# Analysis and Impact of LockBit Ransomware's First Linux and VMware ESXi Variant

LockBit ransomware's operators announced the release of its first Linux and ESXi variant in October. With samples also spotted in the wild, we discuss the impact and analysis of this variant.

In our monitoring of the LockBit **ransomware**'s intrusion set, we found an announcement for LockBit Linux-ESXi Locker version 1.0 on October 2021 in the underground forum "RAMP," where potential affiliates can find it. This signifies the LockBit ransomware group's efforts to expand its targets to Linux hosts. Since October, we have been seeing samples of this variant in the wild.

## Analysis of the variant

Lockbit Linux-ESXi Locker version 1.0 uses a combination of Advanced Encryption Standard (AES) and elliptic-curve cryptography (ECC) algorithms for data encryption. From our analysis, we can see that this version of LockBit can accept parameters, as detailed in Figure 1.

```
Usage: %s [OPTION]... -i '/path/to/crypt'
Recursively crypts files in a path or by extention.

Mandatory arguments to long options are mandatory for short options too.
-i, --indir          path to crypt
-m, --minfile        minimal size of a crypted file, no less than 4096
-r, --remove         self remove this file after work
-l, --log            prints the log to the console
-n, --nolog          do not print the log to the file /tmp/locker.log
-d, --daemonize      runs a program as Unix daemon
-w, --wholefile       encrypts whole file
-b, --beginfile       encrypts first N bytes
-e, --extensions     encrypts files by extentions
-o, --nostop         prevent to stop working VM
-p, --wipe           wipe free space
-s, --spot           upper bound limitation value of spot in Mb
```

This version of the ransomware has logging capabilities and can log the following information:

- Processor information

- Volumes in the system

- Total files

- Total encrypted size
- Time spent for encryption

This variant also contains commands necessary for encrypting VM images hosted on ESXi servers, as listed in Table 1.

Command	Description
vm-support --listvms	Obtain a list of all registered and running VMs
esxcli vm process list	Get a list of running VMs
esxcli vm process kill --type force --world-id	Power off the VM from the list
esxcli storage filesystem list	Check the status of data storage
/sbin/vmdumper %d suspend_v	Suspend VM
vim-cmd hostsvc/enable_ssh	Enable SSH
vim-cmd hostsvc/autostartmanager/enable_autostart false	Disable autostart
vim-cmd hostsvc/hostsummary grep cpuModel	Determine ESXi CPU model

LockBit's operators typically threaten to publish data they stole from their victims on their leak site once their targeted organizations have failed to comply with their ransom demands.

## Impact of the variant

The release of this variant is in line with how **modern ransomware** groups have been shifting their efforts to target and encrypt Linux hosts such as ESXi servers. An ESXi server typically hosts multiple VMs, which in turn hold important data or services for an organization. The successful encryption by ransomware of ESXi servers could therefore have a large impact on targeted companies. This trend was spearheaded by

ransomware families like REvil and DarkSide.

operators are also mirroring the transition of organizations to platforms such as ESXi. This development adds LockBit to the list of ransomware families capable of targeting Linux hosts in general and the ESXi platform in particular.

While Linux versions are typically harder to detect, implementing security best practices can still help organizations minimize the possibility of a successful attack. In the case of LockBit, keeping systems up to date can prevent intrusions. This is because LockBit has been known to use access credentials stolen from vulnerable servers and sold in the cybercriminal underground. VMware also provides recommendations for **enhancing the security** of ESXi.

Organizations should also consider the following steps to mitigate ransomware threats:

- Deploy cross-layered detection and response solutions. Find solutions that can anticipate and respond to ransomware activities, techniques, and movements before the threat culminates. **Trend Micro Vision One™**, for example, helps detect and block ransomware components to stop attacks before they can affect an enterprise.
- Create a playbook for attack prevention and recovery. Both an incident response (IR) **playbook** and IR **frameworks** help organizations plan for different attacks.
- Conduct attack simulations. Expose employees to **realistic cyberattack simulations** that can help decision-makers, security personnel, and IR teams identify and prepare for potential security gaps and attacks.
