

SET

Display, set, or remove CMD environment variables. Changes made with SET will remain only for the duration of the current CMD session.

Syntax

```
SET variable
SET variable=string
SET "variable=string"
SET "variable="

SET /A "variable=expression"
SET /P variable=[promptString]
SET "
```

Key

<i>variable</i>	A new or existing environment variable name e.g. _num
<i>string</i>	A text string to assign to the variable.
/A	Arithmetic expression see full details below .
/P	Prompt for user input.

Variable names are not case sensitive but the contents can be.

It is good practice to avoid using any of the following:

Delimiter characters can be used in the string, but not as the first character, to prevent the delimiter being interpreted.

Any extra spaces around either the variable name or the string will be preserved. Spaces like many other scripting languages. So use SET alpha=beta

The first character of the name must not be a space, a period, an underscore or a dollar sign. If you are using the built-in [Windows Environment](#) variables or any other command string.

The CMD shell will fail to read an environment variable if:

SET is an [internal](#) command.
If [Command Extensions](#) are disabled.

Display a variable:

In most contexts, surround the variable name with %
e.g. To display the value of the %_department% variable:
ECHO %_department%

If the variable name is not found, the command will fail to execute.
This can be detected using IF ERRORLEVEL 1

Including extra characters can be useful to display the variable value.
ECHO [%_department%]
ECHO "%_department%"

Type SET without parameters to display all the current environment variables.

Type SET with a variable name to display that variable
SET _department

The SET command invoked with a string (and no equal sign) will display a wildcard list of all matching variables

Display variables that begin with 'P':
SET p
Display variables that begin with an underscore
SET _

Set a variable:

Example of storing a text string:

```
C:\> SET "_dept=Sales and Marketing"
C:\> set _
 _dept=Sales and Marketing
```

(SS64)

SS64.com asks for your consent to use your personal data to:

-  Personalised advertising and content, advertising and content measurement, audience research and services development
-  Store and/or access information on a device
-  Learn more

Your personal data will be processed and information from your device (cookies, unique identifiers, and other device data) may be stored by, accessed by and shared with [134 TCF vendor\(s\)](#) and [63 ad partner\(s\)](#), or used specifically by this site or app.

Some vendors may process your personal data on the basis of legitimate interest, which you can object to by managing your options below. Look for a link at the bottom of this page to manage or withdraw consent in privacy and cookie settings.

Do not consent

Consent

[Manage options](#)

Set a variable that contains a [redirection](#) character, note the position of the quotes which are not saved:

```
SET "_dept=Sales & Marketing"
```

One variable can be based on another, but this is not dynamic
E.g.

```
C:\> set "xx=fish"
C:\> set "msg=%xx% chips"
C:\> set msg
msg=fish chips
```

```
C:\> set "xx=sausage"
C:\> set msg
msg=fish chips
```

```
C:\> set "msg=%xx% chips"
C:\> set msg
msg=sausage chips
```

Avoid starting variable names with a number, this will avoid the variable being mis-interpreted as a [parameter](#)
%123_myvar% < > %1 23_myvar

To display undocumented system variables:

```
SET "
```

Values with Spaces - using SET

There is no hard requirement to use quotation marks.

```
SET _variable=one two three
ECHO %_variable%
```

Adding quotation marks is a better idea.
The variable contents will **not** include the quotation marks.

```
SET "_variable=one & two"
ECHO "%_variable%"
```

If you place quotation marks around the variable name:

```
SET _variable="one & two"
ECHO %_variable%
```

This can be used for long filenames.

```
SET _QuotedPath="H:\Config files\config 64"
COPY %_QuotedPath% C:\Demo\final.xml
```

Alternatively you can add quotes to the file name.

```
SET "_Filename=config 64"
COPY "H:\Config files\"%_Filename%" C:\Demo\final.xml
```

Variable names with spaces

A variable can contain spaces and also the variable name itself can contain spaces, therefore the following assignment:

```
SET _var =MyText
will create a variable called "_var " ← note the trailing space.
```

Prompt for user input

The /P switch allows you to set a variable equal to a line of input entered by the user.
The Prompt string is displayed before the user input is read.

```
@echo off
Set /P _ans=Please enter Department: || Set _ans=NothingChosen
:: remove &'s and quotes from the answer (via string replace)
Set _ans=%_ans:&=%
Set _ans=%_ans:"=%
If "%_ans%"=="NothingChosen" goto sub_error
If /i "%_ans%"=="finance" goto sub_finance
If /i "%_ans%"=="hr" goto sub_hr
goto:eof
```

(SS64)

SS64.com asks for your consent to use your personal data to:

Store and/or access information on a device

Your personal data will be processed and information from your device (cookies, unique identifiers, and other device data) may be stored by, accessed by and shared with [134 TCF vendor\(s\)](#) and [63 ad partner\(s\)](#), or used specifically by this site or app.

Some vendors may process your personal data on the basis of legitimate interest, which you can object to by managing your options below. Look for a link at the bottom of this page to manage or withdraw consent in privacy and cookie settings.

```
:sub_finance
echo You chose the finance dept
goto:eof

:sub_hr
echo You chose the hr dept
goto:eof

:sub_error
echo Nothing was chosen
```

Both the Prompt string and the answer provided can be left empty. If the user does not enter anything (just presses return) then the variable will be unchanged and the [errorlevel](#) will be set to 1.

The script above strips out any '&' and " characters but may still break if the string provided contains both.
For user provided input, it is a good idea to fully [sanitize any input string](#) for potentially problematic characters (unicode/smart quotes etc).

The [CHOICE](#) command is an alternative for user input, CHOICE accepts only one character/keypress, when selecting from a limited set of options it will be faster to use.

Echo a string with no trailing CR/LF

The standard ECHO command will always add a CR/LF to the end of each string displayed, returning the cursor to the start of the next line. SET /P does not do this, so it can be used to display a string. Feed a NUL character into SET /P like this, so it doesn't wait for any user input:

```
Set /P _scratch="This is a test"
```

Place the first line of a file

```
Set /P _MyVar=<MyFilename.txt
Echo %_MyVar%
```

The second and any subsequent

In very early versions of CMD, a

Delete a variable

Type SET with just the variable

```
SET _department=
```

```
Better still, to be sure there is no
(SET _department=)
or
SET "_department="
```

Arithmetic expressions (SET /A)

Placing expressions in "quotes" is not necessary. However, you can use quotes to protect special operators or parentheses. A best practice is to use quotes for the variable names.

When referring to a variable in your expression, SET /A allows you to omit the %<var> if the variable name is _myvar instead of %_myvar%

The expression to be evaluated can include the following operators:
For the Modulus operator use (%) on the command line, or in a batch script it must be [doubled up](#) to (%%) as below.
This is to distinguish it from a [FOR](#) parameter.

+	Add	set /a "_num=_num+5"	
+=	Add variable	set /a "_num+=5"	
-	Subtract	set /a "_num=_num-5"	
-=	Subtract variable	set /a "_num-=5"	
*	Multiply	set /a "_num=_num*5"	
=	Multiply variable	set /a "_num=5"	
/	Divide	set /a "_num=_num/5"	
/=	Divide variable	set /a "_num/=5"	
%%	Modulus	set /a "_num=17%%5"	
%%=	Modulus	set /a "_num%%=5"	
!	Logical negation	0 (FALSE) ⇔ 1 (TRUE) and any non-zero value (TRUE) ⇔ 0 (FALSE)	
~	Bitwise invert		
&	AND	set /a "_num=5&3"	0101 AND 0011 = 0001 (decimal 1)
&=	AND variable	set /a "_num&=3"	
	OR	set /a "_num=5 3"	0101 OR 0011 = 0111 (decimal 7)
=	OR variable	set /a "_num =3"	
^	XOR	set /a "_num=5^3"	0101 XOR 0011 = 0110 (decimal 6)
^=	XOR variable	set /a "_num ^=3"	
<<	Left Shift .	(sign bit ⇔ 0) An arithmetic shift.	

```
>> Right Shift.      (Fills in the sign bit such that a negative number always remains negative.)
                        Neither ShiftRight nor ShiftLeft will detect overflow.
<=<= Left Shift variable      set /a "_num<=<=2"
>>= Right Shift variable     set /a "_num>>=2"

( ) Parenthesis group expressions  set /a "_num=(2+3)*5"
,   Commas separate expressions    set /a "_num=2,_result=_num*5"
```

Any SET /A calculation that returns a fractional result will be rounded down to the nearest whole integer.

Floating point arithmetic is not supported but you can call [PowerShell](#) for that: powershell.exe 12.9999999 + 2105001.01
or in a batch file:
For /F %%G in ('powershell.exe 12.9999999 + 2105001.01') do Echo Result: %%G

If a variable name is specified as part of the expression, but is not defined in the current environment, then SET /a will use a value of 0.

SET /A arithmetic shift operators do not detect overflow which can cause problems for any non-trivial math, e.g. the bitwise invert often incorrectly reverses the + / - sign of the result.

See [SET /a examples](#) below and [this forum thread](#) for more.
also see [SetX](#), [VarSearch](#) and [VarSubstring](#) for more on variable manipulation.

SET /A should work within the full range of 32 bit signed integer numbers (-2,147,483,648 through 2,147,483,647) but in practice for negative integers it will not go below -2,147,483,647 because the correct two's complement result 2,147,483,648 would cause a positive overflow.

Examples

```
SET /A "_result=2+4"
(=6)
```

```
SET /A "_result=5"
(=5)
SET /A "_result+=5"
(=10)
```

```
SET /A "_result=2<<3"
(=16) { 2 Lsh 3 = binary
```

```
SET /A "_result=5%%2"
(=1) { 5/2 = 2 + 2 remai
```

```
SET /A "_var1=_var2=_var3"
(sets 3 variables to the
```

SET /A will treat any character s
variables without having to type

Multiple calculations can be per

```
Set "_year=1999"
Set /a "_century=_year/100"
```

The numbers must all be within t
use [PowerShell](#) or [VBScript](#).

You can also store a math expression in a variable and substitute in different values, rather like a [macro](#).

```
SET "_math=(#+6)*5"
SET /A _result="%_math:#=4%"
Echo %_result%
SET /A _result="%_math:#=10%"
Echo %_result%
```

Leading Zero will specify Octal

Numeric values are decimal numbers, unless prefixed by
0x for hexadecimal numbers,
0 for octal numbers.

So 0x10 = 020 = 16 decimal

The octal notation can be confusing - all numeric values that start with zeros are treated as octal but 08 and 09 are not valid octal digits.
For example SET /a "_month=07" will return the value 7, but SET /a "_month=09" will return an error.

Permanent changes

Changes made using the SET command are NOT permanent, they apply to the current CMD prompt only and remain only until the CMD window is closed.
To permanently change a variable at the command line use [SetX](#)
or with the GUI: Control Panel → System → Environment → System/User Variables

Changing a variable permanently with SetX will not affect any CMD prompt that is already open.
Only new CMD prompts will get the new setting.

You can of course use SetX in conjunction with SET to change both at the same time:

```
Set _Library=T:\Library\  
SetX _Library T:\Library\ /m
```

Change the environment for other sessions

Neither SET nor SetX will affect other CMD sessions that are already running on the machine. This as a good thing, particularly on multi-user machines, your scripts won't have to contend with a dynamically changing environment while they are running.

It is possible to add permanent environment variables to the registry (HKCU\Environment), but this is an undocumented (and likely unsupported) technique and still it will not take effect until the users next login.

System environment variables can be added to the registry (HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\Environment)

CALL SET

The CALL SET syntax will expand the value of one variable based on the value of another variable. CALL SET can be used to create a loop or a recursive definition. A faster to execute solution is to use a batch file.

Autoexec.bat

Any SET statement in c:\autoexec.bat will be executed when the command prompt starts. Variables set in this way are not permanent. They will appear at the CMD prompt until the next login.

If autoexec.bat CALLS any second batch file, the SET command will be executed in that batch file. This behaviour can be useful on multi-user machines.

Errorlevels

When [CMD Command Extension](#) is enabled:

Event	Event ID
If the variable was successfully set	1073750987
SET No variable found or invalid syntax	1073750988
SET _var=value when _var is already set	1073750989
SET /P Empty response from user.	1073750990
SET /A Unbalanced parentheses	1073750991
SET /A Missing operand	1073750992
SET /A Syntax error	1073750993
SET /A Invalid number	1073750994
SET /A Number larger than 32-bits	1073750995
SET /A Division by zero	1073750996

If the Errorlevel is *unchanged*, typically it will be 0 but if a previous command set an errorlevel, that will be preserved (this is a bug).

```
# I got my mind set on you  
# I got my mind set on you... - Rudy Clark (James Ray/George Harrison)
```

Related commands

- [Syntax - VarSubstring](#) Extract part of a variable (substring).
- [Syntax - VarSearch](#) Search & replace part of a variable.
- [Syntax - Environment Variables](#) - List of default variables.
- [CALL](#) - Evaluate environment variables.

CHOICE - Accept keyboard input to a batch file.

ENDLOCAL - End localisation of environment changes, use to return values.

EXIT - Set a specific ERRORLEVEL.

PATH - Display or set a search path for executable files.

REG - Read or Set Registry values.

SETLOCAL - Begin localisation of environment variable changes.

SETX - Set an environment variable permanently.

Parameters - get a full or partial pathname from a command line variable.

StackOverflow - Storing a Newline in a variable.

Equivalent PowerShell: **Set-Variable** - Set a variable and a value (set/sv).

Equivalent PowerShell: **Read-Host** - Prompt for user input.

Equivalent bash command (Linux): **env** - Display, set, or remove environment variables.
