

New SysJoker Backdoor Targets Windows, Linux, and macOS

Written by **Avigayil Mechtinger**, **Ryan Robinson** and **Nicole Fishbein** - 11 January 2022

System update

Malware targeting multiple operating systems has become no exception in the malware threat landscape. [Vermilion Strike](#), which was documented just last September, is among the latest examples until now.

In December 2021, we discovered a new multi-platform backdoor that targets Windows, Mac, and

This website stores cookies and tracking technologies. These cookies are used in order to improve your browsing experience, for analytics purposes, and to serve targeted ads. By using and accessing this site, you agree to our [Terms of Use](#) and [Privacy Policy](#).

Accept

Windows PE versions. Based on Command and Control (C2) domain registration and samples found in VirusTotal, we estimate that the SysJoker attack was initiated during the second half of 2021.

SysJoker masquerades as a system update and generates its C2 by decoding a string retrieved from a text file hosted on Google Drive. During our analysis the C2 changed three times, indicating the attacker is active and monitoring for infected machines. Based on victimology and malware's behavior, we assess that SysJoker is after specific targets.

SysJoker was uploaded to VirusTotal with the suffix .ts which is used for [TypeScript](#) files. A possible attack vector for this malware is via an infected npm package.

Below we provide a technical analysis of this malware together with IoCs and detection and response mitigations.

Technical Analysis of SysJoker

The malware is written in C++ and each sample is tailored for the specific operating system it targets. Both the [macOS](#) and Linux samples are fully undetected in VirusTotal.

e06e06752509f9cd8bc85aa1aa24dba2 in VirusTotal targeting Mac M1 processor

and has only 6 detections at the time of this writing.

The Dropper drops a zipped SysJoker (**53f1bb23f670d331c9041748e7e8e396**) from C2 [https://github\[.\]url-mini\[.\]com/msg.zip](https://github[.]url-mini[.]com/msg.zip), copies it to *C:\ProgramData\RecoverySystem\recoveryWindows.zip*, unzips it and executes it. All of these actions are executed via PowerShell commands.

Process tree showing PowerShell commands.

Once SysJoker (**d90d0f4d6dad402b5d025987030cc87c**) is executed it sleeps for a random duration between 90 to 120 seconds. Then, it will create the *C:\ProgramData\SystemData* directory and copy itself under this directory, masquerading as *igfxCUIService.exe* (igfxCUIService stands for Intel Graphics Common User Interface Service). Next, it will gather information about the machine using Living off the Land (LOtL) commands. SysJoker uses different temporary text files to log the results of the commands. These text files are deleted immediately, stored in a JSON object, and then encoded and written to a file named *microsoft_windows.dll*. The figure below shows the JSON object built in memory by SysJoker.

The following screenshot shows the processes tree and commands.

Processes tree and commands.

Next, SysJoker will begin its C2 communication.

Decoding/Encoding Scheme

SysJoker holds within the binary a hardcoded XOR key which is used for decoding and encoding strings from within the binary and data sent and received from the C2. The XOR key is an RSA public key that is not used in the decoding scheme. The same XOR key exists in all versions of SysJoker:

```
MIGfMA0GCSqGSIb3DQEBAQUAA4GNADCBiQKBgQDkfNI+Se7jm7sGSrSSUpV3HUI3vEwuh+xn4q\
BY6aRFL91x0HlgcH2AM2rOILdoV8v1vtG1oPt9QpC1jSxShnFw8evGrYnqaou7gLSY5J2B06eq5UW7\
+OXgb77WNbU90vyUbZAucfzy0eF1HqtBNbkXiQ6SSbquuvFPUepqUEjUSQIDAQAB
```

Resolving C2

Decoding with [CyberChef](#).

The Google Drive link hosts a text file named *domain.txt* that holds an encoded C2. The text file's content changes over time, depending on the current available C2. SysJoker will decode the C2 and send the collected user's information to the C2's ***/api/attach*** directory as an initial handshake. The C2 replies with a unique token which will be used as an identifier from now on when the malware communicates with the C2.

C2 Instructions

SysJoker runs a while(1) loop that sends a request to the C2's ***/api/req*** directory with the unique token and will process the C2's response which is built as JSON using functions from [this library](#). This is how SysJoker pings the C2 for instructions (see step 2 in the image below):

remove_reg and *exit* are not implemented in this current version. Based on the instruction names, we can assume that they are in charge of self-deletion of the malware. Let's look into *exe* and *cmd* instructions:

exe – This command is in charge of dropping and running an executable. SysJoker will receive a URL to a zip file, a directory for the path the file should be dropped to, and a filename that the malware should use on the extracted executable. It will download this file, unzip it and execute it.

Accept

IDA code snippet of the parsing function, if exe part.

After execution, the malware will reply to the C2's **/api/req/res** API with either "success" if the process went successful or "exception" if not (step 4 in the image above).

Accept

IDA code snippet of the parsing function, building response status.

cmd – This instruction is in charge of running a command and uploading its response to the C2. SysJoker will decode the command, execute it and upload the command's response to the C2 via **/api/req/res** API (step 4 in the image above).

To detect if a machine in your organization has been compromised, we recommend taking the following steps:

1. Use memory scanners to detect SysJoker payload in memory

- For Linux machines, use [Intezer Protect](#) to gain full runtime visibility over the code in your Linux-based systems and get alerted on any malicious or unauthorized code. [We have a free community edition.](#)
- For Windows machines, use Intezer's [Endpoint Scanner](#). The Endpoint Scanner will provide you with visibility into the type and origin of all binary code that resides in your machine's memory. The figure below shows an example of an endpoint infected with SysJoker:

2. Use detection content to search in your EDR or SIEM. We provided you with IoCs and a rich list of detection content for each operating system below. Use these with your EDR to hunt for infected machines. **We will publish a dedicated blog soon discussing how to use detection content for detecting SysJoker.**

If you have been compromised, take the following steps:

This website stores cookies and tracking technologies. These cookies are used in order to improve your browsing experience, for analytics purposes, and to serve targeted ads. By using and accessing this site, you agree to our [Terms of Use](#) and [Privacy Policy](#).

Accept

3. Investigate the initial entry point of the malware. If a server was infected with SysJoker, in the course of this investigation, check:
 - Configuration status and password complexity for publicly facing services
 - Used software versions and possible known exploits

SysJoker's Linux and Windows versions are now indexed in [Intezer Analyze](#).

Final Points

There are indications that SysJoker attack is performed by an advanced threat actor:

1. The fact that the code was written from scratch and hasn't been seen before in other attacks.

Accept

Based on the malware's capabilities we assess that the goal of the attack is espionage together with lateral movement which might also lead to a ransomware attack as one of the next stages.

You can find more information about SysJoker in [Intezer Analyze](#), which now has the Linux and Windows versions indexed.

Avigayil Mechtinger

Avigayil was previously a product manager at Intezer. Prior to that role, Avigayil was part of Intezer's research team and specialized in malware analysis and threat hunting. During her time at Intezer, she uncovered and documented different malware targeting both Linux and Windows platforms. She is now a Threat Researcher at Wiz.

Ryan Robinson

Ryan is a security researcher analyzing malware and scripts. Formerly, he was a researcher on Anomali's Threat Research Team.
