Localtonet offers a variety of protocols and tunnels that users can create and use to securely access their local or private network services from the internet. These protocols and tunnels include HTTP, HTTPS, TCP, and UDP, and they are designed to provide users with the flexibility and versatility they need to meet their specific needs.

For example, users can create an HTTP tunnel to access web-based services on their local server, or use a TCP or UDP tunnel to access other network services such as gaming servers or VoIP applications. In addition, Localtonet's support for HTTPS provides users with an extra layer of security and privacy, ensuring that their data is encrypted and protected at all times.

Overall, Localtonet's diverse range of protocol types and tunnels ensures that users can securely access their local or private network services from the internet using the method that best suits their needs.
