Hunting for PowerShell Abuse

PowerShell is the favorite tool of IT guys, who are responsible for administration of Windows infrastructures. It allows them to manage different services of the operating system and automate almost anything. But along with administrators, PowerShell also is liked by attackers and malware authors. The reason PowerShell is so attractive for adversaries is quite obvious: it has been included in essentially every Windows operating system by default for a decade, provides access to Windows API, and is rarely constrained, thus allowing adversaries to perform different tasks without risking being blocked. Attackers can use PowerShell to direct the execution of a local script, retrieve and execute remote resources using various network protocols, encode payloads passed via the command line, or load PowerShell into other processes.

Because of so prevalence of PowerShell among adversaries for Threat Hunters it is very important to be able to detect malicious uses of PowerShell and defend against it. In the presentation author is going to demonstrate an approaches for detection of PowerShell abuses based on different event sources like native Windows logging capabilities as well as usage of additional tools, like Sysmon or EDR solutions. How to collect traces of using PowerShell, how to filter out false positives, and how to find evidence of malicious uses among the remaining after filtering

volume of events – all these questions will be answered in the talk for present and future threat hunters.

1. Hunting For PowerShell Abuse Teymur Kheirkhabarov Moscow, 17 June 2019

Head of Cyber Defense Center, BI.ZONE 1

2. • Head of Cyber Defense Center at BI.ZONE • Threat

Hunter • Big fan of ELK stack • ZeroNights / PHDays / OFFZONE speaker • GIAC GXPN certified • Ex- Head of SOC R&D at Kaspersky Lab • Ex- SOC Analyst • Ex- Infosec Admin/Engineer • Ex- Sysadmin • Twitter @HeirhabarovT • heirhabarov@gmail.com 2 Who am I

3. 3 What are we going to talk about?

4. 4 What is PowerShell? • Task automation and configuration management

framework from Microsoft; • Consisting of a command-line shell and associated scripting language; • Built on the .NET Framework; • Enabling administrators to perform administrative tasks on both local and remote Windows systems; • Installed and enabled by default on Windows 7, Server 2012 and later; • It was made open-source and cross-platform on 18 August 2016 with the introduction of PowerShell Core. Operating System Installed PS Version Supported PS Versions Windows 7 2.0 2.0, 3.0, 4.0, 5.0, 5.1 Windows Server 2008 R2 2.0 (***) 2.0, 3.0, 4.0, 5.0, 5.1 Windows 8 3.0 2.0, 3.0 Windows Server 2012 3.0 2.0, 3.0, 4.0 Windows 8.1 4.0 2.0, 4.0, 5.0, 5.1 Windows Server 2012 R2 4.0 2.0, 4.0, 5.0, 5.1 Windows 10 5.1 2.0 Windows Server 2016 5.1 2.0 ** PowerShell 2.0 is included in all latter Windows versions

5. 5 Why attackers love PowerShell? • It is installed and

enabled by default; • Most attacker logic can be written in PowerShell without the need to install malicious binaries (interaction with .NET & Windows API, execution of payloads directly from memory, downloading & execution code from another system, etc.); • It has remote access capabilities by default; • As a script, it is easy to obfuscate and difficult to detect with signature-based approach; • Many sysadmins use and trust it, allowing PowerShell malware to blend in with regular administration work; • Most organizations are not watching PowerShell activity.
POWERSHELL EMPIRE NISHANG PS > ATTACK Invoke-Mimikatz

6. 6 How much attackers love PowerShell?

7. 7 PowerShell Execution Policies aren't about security Execution Policy is

not a security measure as it is known and can be easily overcome. It has been developed to prevent the damage they cause users run the script by accident

8. 8 PowerShell Execution Policies aren't about security A lot of

ways to bypass it! <https://blog.netspi.com/15-ways-to-bypass-the-powershell-execution-policy/>
Get-Content .\script.ps1 | powershell.exe -noprofile - type .\script.ps1 | powershell.exe - noprofile - powershell -command "Write-Host Hello from PowerShell!!!" Invoke-Command - scriptblock {Write-Host Hello from PowerShell!!!"} Get-Content .\script.ps1 | Invoke-Expression Set-ExecutionPolicy Bypass -Scope Process powershell -ExecutionPolicy Bypass -File .runme.ps1

9. Event sources for detection of PowerShell abuses 9

10. 10 Events for detection of PowerShell abuses Process monitoring, command

line parameters Windows Event 4688 with command line audit enabled Sysmon Event 1

11. 11 Events for detection of PowerShell abuses Command line parameters.

PowerShell engine log Event 400 in the "Windows PowerShell" log is generated by default whenever the PowerShell starts. It doesn't require any special audit configuration. Since PowerShell 5.0 HostApplication file of this event contains command line.

12. 12 Events for detection of PowerShell abuses Command line parameters.

Services / scheduled tasks Event 7045 (service installation) from System event log is generated by default without any specific audit configuration. Event 4698 (scheduled task creation) from Security event log requires audit configuration.

13. 13 Events for detection of PowerShell abuses Command line parameters.

WMI consumers Event 5861 from Microsoft-Windows-WMI- Activity/Operational is generated by default since Windows 10 RS4 when event consumer binding is created.

14. 14 Events for detection of PowerShell abuses Command line parameters.

Persistence registry keys Values of autorun registry keys also can be considered as command lines:

15. 15 Put all command lines in one field if [winlog][channel]

```
== "Microsoft-Windows-Sysmon/Operational" and [winlog][event_id] == 13 and [winlog][event_data][RuleName] == "reg_persistence_cmdline" and [winlog][event_data][Details] != "" {  
mutate { add_field => { "[winlog][event_data][CommandLine]" => "%{[winlog][event_data][Details]}" } } } Put command lines from different types of events in a field with the same name in order to be able to check all suspicious command lines at once with a single query: if [winlog][channel] == "Microsoft-Windows-Sysmon/Operational" and [winlog][event_id] == 20 { if [winlog][event_data][Type] == "Command Line" and [winlog][event_data][Destination] != "" {  
mutate { add_field => { "[winlog][event_data][CommandLine]" => "%{[winlog][event_data][Destination]}" } } } } Autorun registry keys modification events CommandLine WMI consumers creation events
```

16. 16 Events for detection of PowerShell abuses Script Block logging

First appeared In PowerShell v5 and Windows 8.1/2012R2 with KB3000850; Automatically log code blocks if the block's contents match on a list of suspicious commands, even if script block logging is not enabled. These suspicious blocks are logged at the "warning" level in EID 4104, unless script block logging is explicitly disabled; If script block logging is enabled, the blocks that are not considered suspicious will also be logged to EID 4104, but with "verbose" or "information" levels.

17. 17 PowerShell Script Block logging List of suspicious commands in

PowerShell sources <https://github.com/Power Shell/PowerShell/blob/02b5f357a20e6dee9f8e60e3adb9025be3c94490/src/System.Management.Automation/engine/runtime/CompiledScriptBlock.cs>

18. 18 PowerShell Transcription Available since PowerShell 5.0. Lets you capture

the input and output of Windows PowerShell commands into text-based transcripts.

19. 19 PowerShell console history file By default, the PowerShell in

Windows 10 saves the last 4096 commands that are stored in a plain text file located in the profile of each user. This file is created when someone runs an interactive PowerShell session as system.

20. 20 It is impossible to analyze all PowerShell executions! ~

45 000 PC, 30 days period Total process execution events Total PowerShell execution events
Number of PowerShell executions by a regular user
