## 2.3.1 NTSTATUS Values

Feedback Article • 11/16/2021

By combining the NTSTATUS into a single 32-bit numbering space, the following NTSTATUS values are defined. Most values also have a defined default message that can be used to map the value to a human-readable text message. When this is done, the NTSTATUS value is also known as a message identifier.

This document provides the common usage details of the NTSTATUS values; individual protocol specifications provide expanded or modified definitions when needed.

In the following descriptions, a percentage sign that is followed by one or more alphanumeric characters (for example, "%1" or "%hs") indicates a variable that is replaced by text at the time the value is returned.
