⊗ Caution

Certutil isn't recommended to be used in any production code and doesn't provide any guarantees of live site support or application compatibilities. It's a tool utilized by developers and IT administrators to view certificate content information on devices.

Certutil.exe is a command-line program installed as part of Certificate Services. You can use certutil.exe to display certification authority (CA) configuration information, configure Certificate Services, and back up and restore CA components. The program also verifies certificates, key pairs, and certificate chains.

If certutil is run on a certification authority without other parameters, it displays the current certification authority configuration. If certutil is run on a non-certification authority without other parameters, the command defaults to running the certutil -dump command. Not all versions of certutil provide all of the parameters and options that this document describes. You can see the choices that your version of certutil provides by running certutil -? or certutil <parameter> -?.

To see complete help for all certutil verbs and options, including ones that are hidden from the -? argument, run certutil -v -usage. The usage switch is case-sensitive.

Parameters

-dump

Dumps the configuration information or files.

```
Windows Command Prompt
                                                                         Copy
certutil [options] [-dump]
certutil [options] [-dump] File
```

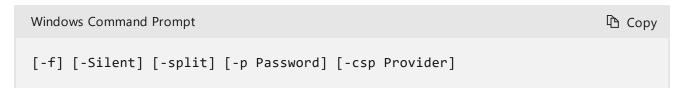

-dumpPFX

Dumps the PFX structure.

Options:

-asn

Parses and displays the contents of a file using Abstract Syntax Notation (ASN.1) syntax. File types include .CER, .DER and PKCS #7 formatted files.

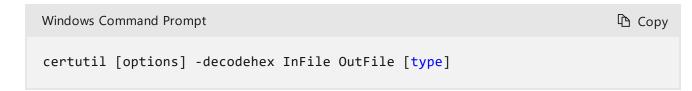

```
Windows Command Prompt

certutil [options] -asn File [type]
```

• [type]: numeric CRYPT_STRING_* decoding type

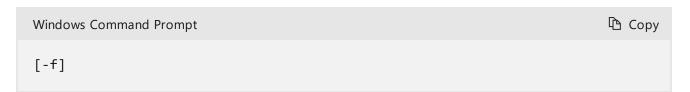

-decodehex

Decodes a hexadecimal-encoded file.

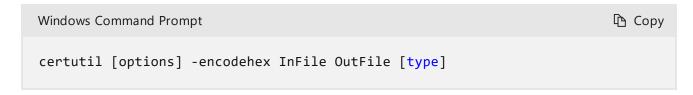

• [type]: numeric CRYPT_STRING_* decoding type

Options:

-encodehex

Encodes a file in hexadecimal.

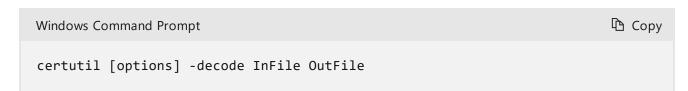

• [type]: numeric CRYPT_STRING_* encoding type

Options:

[-f] [-nocr] [-nocrlf] [-UnicodeText]

-decode

Decodes a Base64-encoded file.

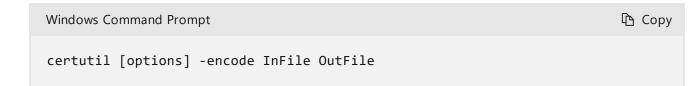

Options:

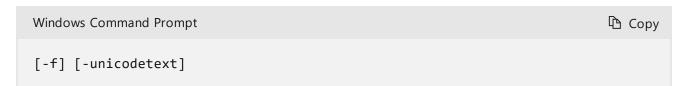

-encode

Encodes a file to Base64.

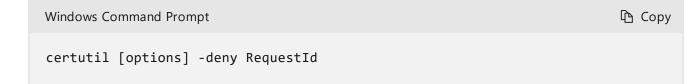

Options:

-deny

Denies a pending request.

Options:

-resubmit

Resubmits a pending request.

Windows Command Prompt	🖺 Сору
[-config Machine\CAName]	

-setattributes

Sets attributes for a pending certificate request.

Where:

- RequestId is the numeric Request ID for the pending request.
- AttributeString is the request attribute name and value pairs.

Options:

Remarks

• Names and values must be colon separated, while multiple names and value pairs must be newline separated. For example:

CertificateTemplate:User\nEMail:User@Domain.com where the \n sequence is converted to a newline separator.

-setextension

Set an extension for a pending certificate request.

Where:

- requestID is the numeric Request ID for the pending request.
- ExtensionName is the ObjectId string for the extension.
- Flags sets the priority of the extension. 0 is recommended, while 1 sets the extension to critical, 2 disables the extension, and 3 does both.

Options:

Remarks

- If the last parameter is numeric, it's taken as a Long.
- If the last parameter can be parsed as a date, it's taken as a Date.
- If the last parameter starts with \@, the rest of the token is taken as the filename with binary data or an ascii-text hex dump.
- If the last parameter is anything else, it's taken as a String.

-revoke

Revokes a certificate.

```
Windows Command Prompt

Certutil [options] -revoke SerialNumber [Reason]
```

Where:

- SerialNumber is a comma-separated list of certificate serial numbers to revoke.
- **Reason** is the numeric or symbolic representation of the revocation reason, including:
 - 0. CRL_REASON_UNSPECIFIED Unspecified (default)
 - o 1. CRL_REASON_KEY_COMPROMISE Key compromise
 - o 2. CRL_REASON_CA_COMPROMISE Certificate Authority compromise
 - o 3. CRL_REASON_AFFILIATION_CHANGED Affiliation changed
 - o 4. CRL_REASON_SUPERSEDED Superseded
 - 5. CRL_REASON_CESSATION_OF_OPERATION Cessation of operation
 - o 6. CRL_REASON_CERTIFICATE_HOLD Certificate hold
 - 8. CRL_REASON_REMOVE_FROM_CRL Remove from CRL
 - 9: CRL_REASON_PRIVILEGE_WITHDRAWN Privilege withdrawn
 - 10: CRL_REASON_AA_COMPROMISE AA compromise
 - -1. Unrevoke Unrevokes

Options:

-isvalid

Displays the disposition of the current certificate.

Options:

-getconfig

Gets the default configuration string.

Options:

-getconfig2

Gets the default configuration string via ICertGetConfig.

Windows Command Prompt

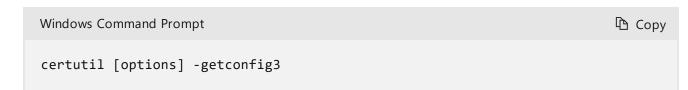

© Copy

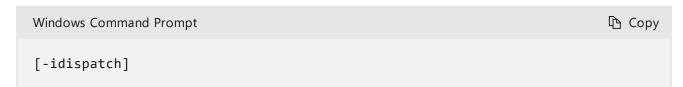

Windows Command Prompt	🖺 Сору
[-idispatch]	

-getconfig3

Gets configuration via ICertConfig.

Options:

-ping

Attempts to contact the Active Directory Certificate Services Request interface.

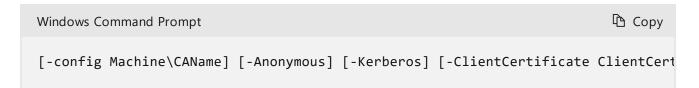

```
Windows Command Prompt

Certutil [options] -ping [MaxSecondsToWait | CAMachineList]
```

Where:

• CAMachineList is a comma-separated list of CA machine names. For a single machine, use a terminating comma. This option also displays the site cost for each CA machine.

Options:

-pingadmin

Attempts to contact the Active Directory Certificate Services Admin interface.

Options:

-CAInfo

Displays information about the certification authority.

Windows Command Prompt

Certutil [options] -CAInfo [InfoName [Index | ErrorCode]]

- InfoName indicates the CA property to display, based on the following infoname argument syntax:
 - * Displays all properties
 - o ads Advanced Server
 - o aia [Index] AIA URLs
 - o cdp [Index] CDP URLs
 - o cert [Index] CA cert
 - o certchain [Index] CA cert chain
 - **certcount** CA cert count
 - o certcrlchain [Index] CA cert chain with CRLs
 - o certstate [Index] CA cert
 - o certstatuscode [Index] CA cert verify status
 - certversion [Index] CA cert version
 - CRL [Index] Base CRL
 - o cristate [Index] CRL
 - o cristatus [Index] CRL Publish Status
 - o cross- [Index] Backward cross cert
 - o cross+ [Index] Forward cross cert
 - o crossstate-[Index] Backward cross cert
 - o crossstate + [Index] Forward cross cert
 - o deltacrl [Index] Delta CRL
 - o deltacristatus [Index] Delta CRL Publish Status
 - o dns DNS Name
 - o dsname Sanitized CA short name (DS name)
 - o error1 ErrorCode Error message text
 - o error2 ErrorCode Error message text and error code
 - o exit [Index] Exit module description
 - **exitcount** Exit module count
 - o file File version
 - o info CA info
 - kra [Index] KRA cert
 - o kracount KRA cert count
 - o krastate [Index] KRA cert
 - kraused KRA cert used count
 - o localename CA locale name
 - o name CA name
 - o ocsp [Index] OCSP URLs
 - o parent Parent CA
 - o policy Policy module description
 - o product Product version
 - o propidmax Maximum CA Propld
 - o role Role Separation
 - o sanitizedname Sanitized CA name
 - o sharedfolder Shared folder
 - o subjecttemplateoids Subject Template OIDs
 - **templates** Templates
 - o type CA type
 - o xchg [Index] CA exchange cert
 - o xchgchain [Index] CA exchange cert chain
 - xchgcount CA exchange cert count
 - o xchgcrlchain [Index] CA exchange cert chain with CRLs
- index is the optional zero-based property index.

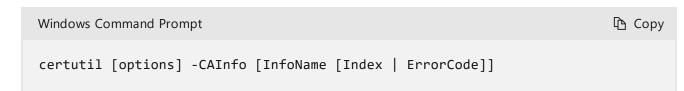

• errorcode is the numeric error code.

Options:

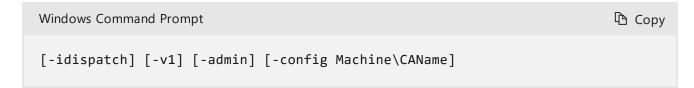

-CAPropInfo

Displays CA Property Type information.

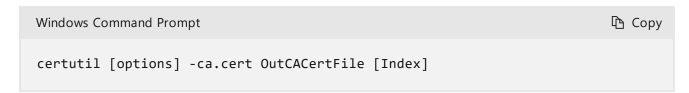

Options:

-ca.cert

Retrieves the certificate for the certification authority.

Where:

- OutCACertFile is the output file.
- Index is the CA certificate renewal index (defaults to most recent).

Options:

-ca.chain

Retrieves the certificate chain for the certification authority.

Where:

- OutCACertChainFile is the output file.
- Index is the CA certificate renewal index (defaults to most recent).

```
Windows Command Prompt

[-f] [-split] [-config Machine\CAName]
```

-GetCRL

Gets a certificate revocation list (CRL).

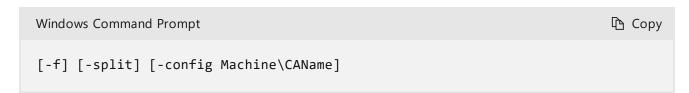

```
Windows Command Prompt

Certutil [options] -GetCRL OutFile [Index] [delta]
```

Where:

- Index is the CRL index or key index (defaults to CRL for most recent key).
- **delta** is the delta CRL (default is base CRL).

Options:

-CRL

Publishes new certificate revocation lists (CRLs) or delta CRLs.

```
Windows Command Prompt

certutil [options] -CRL [dd:hh | republish] [delta]
```

Where:

- dd:hh is the new CRL validity period in days and hours.
- republish republishes the most recent CRLs.
- delta publishes the delta CRLs only (default is base and delta CRLs).

Options:

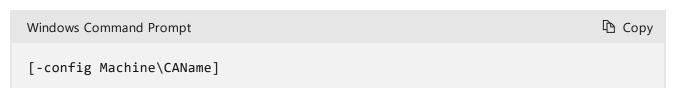

-shutdown

Shuts down the Active Directory Certificate Services.

Options:

-installCert

Installs a certification authority certificate.

```
Windows Command Prompt

certutil [options] -installCert [CACertFile]
```

-renewCert

Renews a certification authority certificate.

```
Windows Command Prompt

certutil [options] -renewCert [ReuseKeys] [Machine\ParentCAName]
```

Options:

```
Windows Command Prompt

[-f] [-silent] [-config Machine\CAName]
```

• Use -f to ignore an outstanding renewal request, and to generate a new request.

-schema

Dumps the schema for the certificate.

```
Windows Command Prompt

Certutil [options] -schema [Ext | Attrib | CRL]
```

Where:

- The command defaults to the Request and Certificate table.
- Ext is the extension table.
- Attribute is the attribute table.
- CRL is the CRL table.

Options:

-view

Dumps the certificate view.

- Queue dumps a specific request queue.
- Log dumps the issued or revoked certificates, plus any failed requests.
- LogFail dumps the failed requests.
- Revoked dumps the revoked certificates.
- Ext dumps the extension table.
- Attrib dumps the attribute table.
- CRL dumps the CRL table.

• csv provides the output using comma-separated values.

Options:

```
Windows Command Prompt

[-silent] [-split] [-config Machine\CAName] [-restrict RestrictionList] [-out Co
```

Remarks

- To display the **StatusCode** column for all entries, type -out StatusCode
- To display all columns for the last entry, type: -restrict RequestId==\$
- To display the **RequestId** and **Disposition** for three requests, type: -restrict requestID>=37,requestID<40 -out requestID, disposition
- To display Row IDs Row IDs and CRL numbers for all Base CRLs, type: -restrict crlminbase=0 -out crlrowID, crlnumber crl
- To display Base CRL number 3, type: -v -restrict crlminbase=0,crlnumber=3 -out crlrawcrl crl
- To display the entire CRL table, type: CRL
- Use Date[+|-dd:hh] for date restrictions.
- Use now+dd:hh for a date relative to the current time.
- Templates contain Extended Key Usages (EKUs), which are object identifiers (OIDs) that
 describe how the certificate is used. Certificates don't always include template common
 names or display names, but they always contain the template EKUs. You can extract the
 EKUs for a specific certificate template from Active Directory and then restrict views
 based on that extension.

-db

Dumps the raw database.

```
Windows Command Prompt

Certutil [options] -db
```

Options:

```
Windows Command Prompt

[-config Machine\CAName] [-restrict RestrictionList] [-out ColumnList]
```

-deleterow

Deletes a row from the server database.

Where:

- Request deletes the failed and pending requests, based on submission date.
- Cert deletes the expired and revoked certificates, based on expiration date.
- Ext deletes the extension table.
- Attrib deletes the attribute table.
- CRL deletes the CRL table.

```
Windows Command Prompt

[-f] [-config Machine\CAName]
```

Examples

- To delete failed and pending requests submitted by January 22, 2001, type: 1/22/2001
- To delete all certificates that expired by January 22, 2001, type: 1/22/2001 cert
- To delete the certificate row, attributes, and extensions for RequestID 37, type: 37
- To delete CRLs that expired by January 22, 2001, type: 1/22/2001 crl

① Note

Date expects the format mm/dd/yyyy rather then dd/mm/yyyy, for example 1/22/2001 rather than 22/1/2001 for January 22, 2001. If your server isn't configured with US regional settings, using the Date argument might produce unexpected results.

-backup

Backs up the Active Directory Certificate Services.

```
Windows Command Prompt

certutil [options] -backup BackupDirectory [Incremental] [KeepLog]
```

Where:

- BackupDirectory is the directory to store the backed up data.
- Incremental performs an incremental backup only (default is full backup).
- **KeepLog** preserves the database log files (default is to truncate log files).

Options:

-backupDB

Backs up the Active Directory Certificate Services database.

```
Windows Command Prompt

Certutil [options] -backupdb BackupDirectory [Incremental] [KeepLog]
```

Where:

- BackupDirectory is the directory to store the backed up database files.
- Incremental performs an incremental backup only (default is full backup).
- **KeepLog** preserves the database log files (default is to truncate log files).

-backupkey

Backs up the Active Directory Certificate Services certificate and private key.

```
Windows Command Prompt

certutil [options] -backupkey BackupDirectory
```

Where:

• Backup Directory is the directory to store the backed up PFX file.

Options:

-restore

Restores the Active Directory Certificate Services.

Where:

• Backup Directory is the directory containing the data to be restored.

Options:

-restoredb

Restores the Active Directory Certificate Services database.

Where:

• BackupDirectory is the directory containing the database files to be restored.

Options:

-restorekey

Restores the Active Directory Certificate Services certificate and private key.

```
certutil [options] -restorekey BackupDirectory | PFXFile
```

Where:

- BackupDirectory is the directory containing PFX file to be restored.
- PFXFile is the PFX file to be restored.

Options:

```
Windows Command Prompt

[-f] [-config Machine\CAName] [-p password]
```

-exportPFX

Exports the certificates and private keys. For more information, see the estore parameter in this article.

```
Windows Command Prompt

Certutil [options] -exportPFX [CertificateStoreName] CertId PFXFile [Modifiers]
```

Where:

- **CertificateStoreName** is the name of the certificate store.
- CertId is the certificate or CRL match token.
- PFXFile is the PFX file to be exported.
- Modifiers are the comma-separated list, which can include one or more of the following:
 - **CryptoAlgorithm**= specifies the cryptographic algorithm to use for encrypting the PFX file, such as TripleDES-Shal or Aes256-Sha256.
 - o EncryptCert Encrypts the private key associated with the certificate with a password.
 - **ExportParameters** -Exports the private key parameters in addition to the certificate and private key.
 - **ExtendedProperties** Includes all extended properties associated with the certificate in the output file.
 - NoEncryptCert Exports the private key without encrypting it.
 - o NoChain Doesn't import the certificate chain.
 - o NoRoot Doesn't import the root certificate.

-importPFX

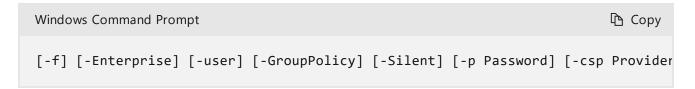

Imports the certificates and private keys. For more information, see the <code>-store</code> parameter in this article.

```
Windows Command Prompt

Certutil [options] -importPFX [CertificateStoreName] PFXFile [Modifiers]
```

- **CertificateStoreName** is the name of the certificate store.
- **PFXFile** is the PFX file to be imported.
- Modifiers are the comma-separated list, which can include one or more of the following:
 - AT_KEYEXCHANGE Changes the keyspec to key exchange.
 - AT_SIGNATURE Changes the keyspec to signature.
 - **ExportEncrypted** Exports the private key associated with the certificate with password encryption.
 - **FriendlyName** = Specifies a friendly name for the imported certificate.

- KeyDescription = Specifies a description for the private key associated with the imported certificate.
- **KeyFriendlyName** = Specifies a friendly name for the private key associated with the imported certificate.
- o NoCert Doesn't import the certificate.
- o NoChain Doesn't import the certificate chain.
- NoExport Makes the private key non-exportable.
- o **NoProtect** Doesn't password protect keys by using a password.
- NoRoot Doesn't import the root certificate.
- Pkcs8 Uses PKCS8 format for the private key in the PFX file.
- **Protect** Protects keys by using a password.
- ProtectHigh Specifies that a high-security password must be associated with the private key.
- VSM Stores the private key associated with the imported certificate in the Virtual Smart Card (VSC) container.

Remarks

Defaults to personal machine store.

-dynamicfilelist

Displays a dynamic file list.

Options:

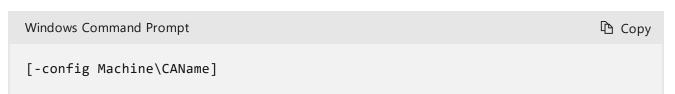

-databaselocations

Displays database locations.

Options:

-hashfile

Generates and displays a cryptographic hash over a file.

```
Windows Command Prompt

Certutil [options] -hashfile InFile [HashAlgorithm]
```

-store

Dumps the certificate store.

```
Windows Command Prompt

certutil [options] -store [CertificateStoreName [CertId [OutputFile]]]
```

Where:

- **CertificateStoreName** is the certificate store name. For example:
 - My, CA (default), Root,
 - Oldap:///CN=Certification Authorities,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?one?
 objectClass=certificationAuthority (View Root Certificates)
 - Oldap:///CN=CAName,CN=Certification Authorities,CN=Public Key Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base? objectClass=certificationAuthority (Modify Root Certificates)
 - O ldap:///CN=CAName,CN=MachineName,CN=CDP,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?
 certificateRevocationList?base?objectClass=cRLDistributionPoint (View CRLs)
 - O ldap:///CN=NTAuthCertificates,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base?
 objectClass=certificationAuthority (Enterprise CA Certificates)
 - ldap: (AD computer object certificates)
 - -user ldap: (AD user object certificates)
- CertId is the certificate or CRL match token. This ID can be a:
 - Serial number
 - SHA-1 certificate
 - o CRL, CTL or public key hash
 - Numeric cert index (0, 1, and so on)
 - Numeric CRL index (.0, .1, and so on)
 - Numeric CTL index (..0, ..1, and so on)
 - Public key
 - o Signature or extension ObjectId
 - Certificate subject Common Name
 - o E-mail address
 - UPN or DNS name
 - Key container name or CSP name
 - o Template name or ObjectId
 - o EKU or Application Policies ObjectId
 - CRL issuer Common Name.

Many of these identifiers might result in multiple matches.

• OutputFile is the file used to save the matching certificates.

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-Silent] [-split] [-dc DCName]
```

- The -user option accesses a user store instead of a machine store.
- The -enterprise option accesses a machine enterprise store.
- The -service option accesses a machine service store.
- The -grouppolicy option accesses a machine group policy store.

For example:

- -enterprise NTAuth
- -enterprise Root 37
- -user My 26e0aaaf000000000004
- CA .11

① Note

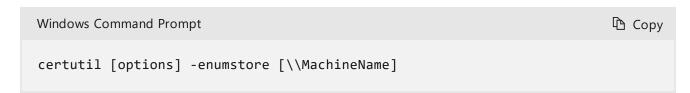

Performance issues are observed when using the -store parameter given these two aspects:

- 1. When the number of certificates in the store exceeds 10.
- 2. When a **CertId** is specified, it's used to match all the listed types for every certificate. For example, if a **serial number** is provided, it will also attempt to match all other listed types.

If you are concerned about performance issues, PowerShell commands are recommended where it will only match the specified certificate type.

-enumstore

Enumerates the certificate stores.

Where:

• MachineName is the remote machine name.

Options:

-addstore

Adds a certificate to the store. For more information, see the -store parameter in this article.

Where:

- CertificateStoreName is the certificate store name.
- InFile is the certificate or CRL file you want to add to the store.

Options:

Windows Command Prompt Copy

```
[-f] [-Enterprise] [-user] [-GroupPolicy] [-dc DCName]
```

-delstore

Deletes a certificate from the store. For more information, see the <code>-store</code> parameter in this article.

```
Windows Command Prompt

certutil [options] -delstore CertificateStoreName certID
```

Where:

- CertificateStoreName is the certificate store name.
- **CertId** is the certificate or CRL match token.

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-Silent] [-dc DCName]
```

-verifystore

Verifies a certificate in the store. For more information, see the estore parameter in this article.

```
Windows Command Prompt

certutil [options] -verifystore CertificateStoreName [CertId]
```

Where:

- CertificateStoreName is the certificate store name.
- CertId is the certificate or CRL match token.

Options:

```
Windows Command Prompt

[-Enterprise] [-user] [-GroupPolicy] [-Silent] [-split] [-dc DCName] [-t Timeout
```

-repairstore

Repairs a key association or update certificate properties or the key security descriptor. For more information, see the <code>-store</code> parameter in this article.

```
Windows Command Prompt

Certutil [options] -repairstore CertificateStoreName CertIdList [PropertyInfFile
```

- CertificateStoreName is the certificate store name.
- **CertIdList** is the comma-separated list of certificate or CRL match tokens. For more information, see the -store CertId description in this article.
- PropertyInfFile is the INF file containing external properties, including:

```
Windows Command Prompt
                                                                   Copy
[Properties]
    19 = Empty; Add archived property, OR:
             ; Remove archived property
    11 = {text}Friendly Name ; Add friendly name property
    127 = {hex}; Add custom hexadecimal property
        _continue_ = 00 01 02 03 04 05 06 07 08 09 0a 0b 0c 0d 0e 0f
        _continue_ = 10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f
    2 = {text}; Add Key Provider Information property
      _continue_ = Container=Container Name&
      _continue_ = Provider=Microsoft Strong Cryptographic Provider&
      _continue_ = ProviderType=1&
      _continue_ = Flags=0&
      _continue_ = KeySpec=2
    9 = {text}; Add Enhanced Key Usage property
      _continue_ = 1.3.6.1.5.5.7.3.2,
      _continue_ = 1.3.6.1.5.5.7.3.1,
```

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-Silent] [-split] [-csp Provider]
```

-viewstore

Dumps the certificates store. For more information, see the -store parameter in this article.

```
Windows Command Prompt

certutil [options] -viewstore [CertificateStoreName [CertId [OutputFile]]]
```

- **CertificateStoreName** is the certificate store name. For example:
 - My, CA (default), Root,
 - o ldap:///CN=Certification Authorities,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?one?
 objectClass=certificationAuthority (View Root Certificates)
 - O ldap:///CN=CAName,CN=Certification Authorities,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base?
 objectClass=certificationAuthority (Modify Root Certificates)
 - O ldap:///CN=CAName,CN=MachineName,CN=CDP,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?
 certificateRevocationList?base?objectClass=cRLDistributionPoint (View CRLs)
 - O ldap:///CN=NTAuthCertificates,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base?
 objectClass=certificationAuthority (Enterprise CA Certificates)
 - ldap: (AD computer object certificates)
 - -user ldap: (AD user object certificates)
- CertId is the certificate or CRL match token. This can be a:
 - Serial number
 - SHA-1 certificate
 - CRL, CTL or public key hash
 - Numeric cert index (0, 1, and so on)

- Numeric CRL index (.0, .1, and so on)
- Numeric CTL index (..0, ..1, and so on)
- o Public key
- Signature or extension ObjectId
- o Certificate subject Common Name
- E-mail address
- UPN or DNS name
- o Key container name or CSP name
- o Template name or ObjectId
- o EKU or Application Policies ObjectId
- o CRL issuer Common Name.

Many of these may result in multiple matches.

• OutputFile is the file used to save the matching certificates.

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-dc DCName]
```

- The -user option accesses a user store instead of a machine store.
- The -enterprise option accesses a machine enterprise store.
- The -service option accesses a machine service store.
- The -grouppolicy option accesses a machine group policy store.

For example:

- -enterprise NTAuth
- -enterprise Root 37
- -user My 26e0aaaf000000000004
- CA .11

-viewdelstore

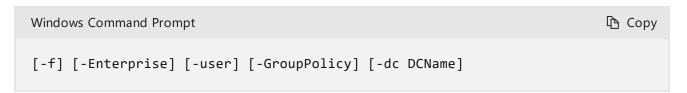

Deletes a certificate from the store.

```
Windows Command Prompt

Certutil [options] -viewdelstore [CertificateStoreName [CertId [OutputFile]]]
```

- **CertificateStoreName** is the certificate store name. For example:
 - My, CA (default), Root,
 - O ldap:///CN=Certification Authorities,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?one?
 objectClass=certificationAuthority (View Root Certificates)
 - O ldap:///CN=CAName,CN=Certification Authorities,CN=Public Key Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base? objectClass=certificationAuthority (Modify Root Certificates)
 - O ldap:///CN=CAName,CN=MachineName,CN=CDP,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?
 certificateRevocationList?base?objectClass=cRLDistributionPoint (View CRLs)
 - o ldap:///CN=NTAuthCertificates,CN=Public Key
 Services,CN=Services,CN=Configuration,DC=cpandl,DC=com?cACertificate?base?
 objectClass=certificationAuthority (Enterprise CA Certificates)

- ldap: (AD computer object certificates)-user ldap: (AD user object certificates)
- CertId is the certificate or CRL match token. This can be a:
 - Serial number
 - o SHA-1 certificate
 - CRL, CTL or public key hash
 - Numeric cert index (0, 1, and so on)
 - Numeric CRL index (.0, .1, and so on)
 - Numeric CTL index (..0, ..1, and so on)
 - Public key
 - o Signature or extension ObjectId
 - o Certificate subject Common Name
 - o E-mail address
 - UPN or DNS name
 - Key container name or CSP name
 - o Template name or ObjectId
 - o EKU or Application Policies ObjectId
 - CRL issuer Common Name. Many of these may result in multiple matches.
- OutputFile is the file used to save the matching certificates.

- The -user option accesses a user store instead of a machine store.
- The -enterprise option accesses a machine enterprise store.
- The -service option accesses a machine service store.
- The -grouppolicy option accesses a machine group policy store.

For example:

- -enterprise NTAuth
- -enterprise Root 37
- -user My 26e0aaaf000000000004
- CA .11

-UI

Invokes the certutil interface.

-TPMInfo

Displays Trusted Platform Module Information.

Options:

Windows Command Prompt

© Copy

```
[-f] [-Silent] [-split]
```

-attest

Specifies that the certificate request file should be attested.

Options:

-getcert

Selects a certificate from a selection UI.

```
Windows Command Prompt

Certutil [options] [ObjectId | ERA | KRA [CommonName]]
```

Options:

```
Windows Command Prompt

[-Silent] [-split]
```

-ds

Displays directory service (DS) distinguished names (DNs).

```
Windows Command Prompt

Certutil [options] -ds [CommonName]
```

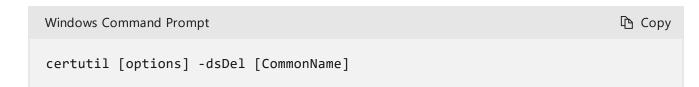

Options:

```
Windows Command Prompt

[-f] [-user] [-split] [-dc DCName]
```

-dsDel

Deletes DS DNs.

Windows Command Prompt	🖺 Сору
[-user] [-split] [-dc DCName]	

-dsPublish

Publishes a certificate or certificate revocation list (CRL) to Active Directory.

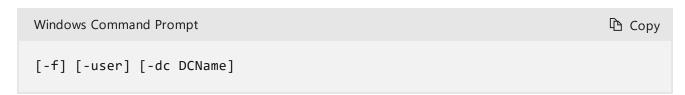

```
Windows Command Prompt

Certutil [options] -dspublish CertFile [NTAuthCA | RootCA | SubCA | CrossCA | KF certutil [options] -dspublish CRLfile [DSCDPContainer [DSCDPCN]]
```

Where:

- CertFile is the name of the certificate file to publish.
- NTAuthCA publishes the certificate to the DS Enterprise store.
- RootCA publishes the certificate to the DS Trusted Root store.
- SubCA publishes the CA certificate to the DS CA object.
- CrossCA publishes the cross-certificate to the DS CA object.
- KRA publishes the certificate to the DS Key Recovery Agent object.
- User publishes the certificate to the User DS object.
- Machine publishes the certificate to the Machine DS object.
- **CRLfile** is the name of the CRL file to publish.
- DSCDPContainer is the DS CDP container CN, usually the CA machine name.
- DSCDPCN is the DS CDP object CN based on the sanitized CA short name and key index.

Options:

Use -f to create a new DS object.

-dsCert

Displays DS certificates.

```
Windows Command Prompt

Certutil [options] -dsCert [FullDSDN] | [CertId [OutFile]]
```

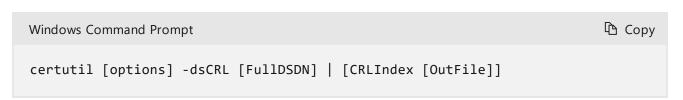

Options:

```
Windows Command Prompt

[-Enterprise] [-user] [-config Machine\CAName] [-dc DCName]
```

-dsCRL

Displays DS CRLs.

```
Windows Command Prompt

[-idispatch] [-Enterprise] [-user] [-config Machine\CAName] [-dc DCName]
```

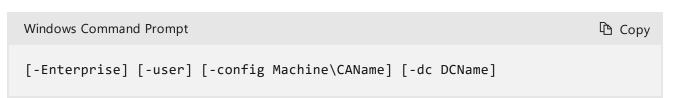

-dsDeltaCRL

Displays DS delta CRLs.

Windows Command Prompt

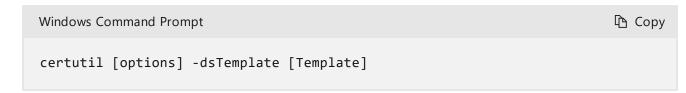

Certutil [options] -dsDeltaCRL [FullDSDN] | [CRLIndex [OutFile]]

Options:

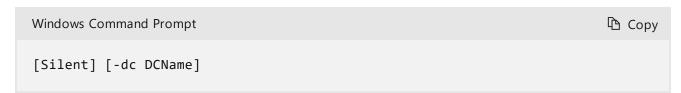

-dsTemplate

Displays DS template attributes.

Options:

-dsAddTemplate

Adds DS templates.

Options:

-ADTemplate

Displays Active Directory templates.

Options:

-Template

Displays the certificate enrollment policy templates.

Options:

```
Windows Command Prompt

certutil [options] -Template [Template]
```

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-PolicyServer URLOrId] [-Anonymous] [-Kerberos] [-Client
```

-TemplateCAs

Displays the certification authorities (CAs) for a certificate template.

```
Windows Command Prompt

Certutil [options] -TemplateCAs Template
```

Options:

```
Windows Command Prompt

[-f] [-user] [-dc DCName]
```

-CATemplates

Displays templates for the Certificate Authority.

```
Windows Command Prompt

certutil [options] -CATemplates [Template]
```

Options:

```
Windows Command Prompt

[-f] [-user] [-ut] [-mt] [-config Machine\CAName] [-dc DCName]
```

-SetCATemplates

Sets the certificate templates that the Certificate Authority can issue.

```
Windows Command Prompt

Certutil [options] -SetCATemplates [+ | -] TemplateList
```

Where:

- The + sign adds certificate templates to the CA's available template list.
- The sign removes certificate templates from the CA's available template list.

-SetCASites

Manages site names, including setting, verifying, and deleting Certificate Authority site names.

```
Windows Command Prompt

certutil [options] -SetCASites [set] [SiteName]
certutil [options] -SetCASites verify [SiteName]
certutil [options] -SetCASites delete
```

Where:

• SiteName is allowed only when targeting a single Certificate Authority.

Options:

```
Windows Command Prompt

[-f] [-config Machine\CAName] [-dc DCName]
```

Remarks

- The -config option targets a single Certificate Authority (default is all CAs).
- The -f option can be used to override validation errors for the specified **SiteName** or to delete all CA site names.

① Note

For more information about configuring CAs for Active Directory Domain Services (AD DS) site awareness, see <u>AD DS Site Awareness for AD CS and PKI clients</u>.

-enrollmentServerURL

Displays, adds, or deletes enrollment server URLs associated with a CA.

```
Windows Command Prompt

Certutil [options] -enrollmentServerURL [URL AuthenticationType [Priority] [Modicertutil [options] -enrollmentserverURL URL delete
```

Where:

- AuthenticationType specifies one of the following client authentication methods while adding a URL:
 - o Kerberos Use Kerberos SSL credentials.
 - o UserName Use a named account for SSL credentials.
 - ClientCertificate Use X.509 Certificate SSL credentials.
 - o Anonymous Use anonymous SSL credentials.
- delete deletes the specified URL associated with the CA.
- Priority defaults to 1 if not specified when adding a URL.
- Modifiers is a comma-separated list, which includes one or more of the following:
 - AllowRenewalsOnly only renewal requests can be submitted to this CA via this URL.
 - AllowKeyBasedRenewal allows use of a certificate that has no associated account in the AD. This applies only with ClientCertificate and AllowRenewalsOnly mode.

Options:

-ADCA

Displays the Active Directory Certificate Authorities.

```
Windows Command Prompt

certutil [options] -ADCA [CAName]
```

Options:

```
Windows Command Prompt

[-f] [-split] [-dc DCName]
```

-CA

Displays the enrollment policy Certificate Authorities.

```
Windows Command Prompt

Certutil [options] -CA [CAName | TemplateName]
```

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-split] [-PolicyServer URLOrId] [-Anonymous] [-Kerberos]
```

-Policy

Displays the enrollment policy.

```
Windows Command Prompt

Certutil [options] -Policy
```

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-split] [-PolicyServer URLOrId] [-Anonymous] [-Kerberos]
```

-PolicyCache

Displays or deletes enrollment policy cache entries.

```
Windows Command Prompt

Certutil [options] -PolicyCache [delete]
```

Where:

- **delete** deletes the policy server cache entries.
- -f deletes all cache entries

-CredStore

Displays, adds, or deletes Credential Store entries.

```
Windows Command Prompt

certutil [options] -CredStore [URL]
certutil [options] -CredStore URL add
certutil [options] -CredStore URL delete
```

Where:

- URL is the target URL. You can also use * to match all entries or https://machine* to match a URL prefix.
- add adds a credential store entry. Using this option also requires the use of SSL credentials.
- delete deletes credential store entries.
- -f overwrites a single entry or deletes multiple entries.

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-Anonymous] [-Kerberos] [-ClientCertificate ClientCertIc
```

-InstallDefaultTemplates

Installs the default certificate templates.

Options:

-URL

Verifies certificate or CRL URLs.

Options:

-URLCache

Displays or deletes URL cache entries.

Windows Command Prompt

© Copy

```
certutil [options] -URLcache [URL | CRL | * [delete]]
```

Where:

- URL is the cached URL.
- CRL runs on all cached CRL URLs only.
- * operates on all cached URLs.
- delete deletes relevant URLs from the current user's local cache.
- -f forces fetching a specific URL and updating the cache.

Options:

```
Windows Command Prompt

[-f] [-split]
```

-pulse

Pulses an autoenrollment event or NGC task.

```
Windows Command Prompt

certutil [options] -pulse [TaskName [SRKThumbprint]]
```

Where:

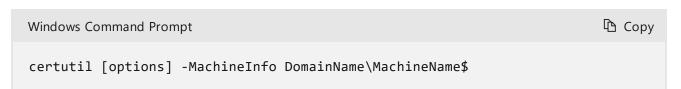

- TaskName is the task to trigger.
 - **Pregen** is the NGC Key pregen task.
 - AIKEnroll is the NGC AIK certificate enrollment task. (Defaults to the autoenrollment event).
- **SRKThumbprint** is the thumbprint of the Storage Root Key
- Modifiers:
 - o Pregen
 - o PregenDelay
 - AIKEnroll
 - CryptoPolicy
 - NgcPregenKey
 - o DIMSRoam

Options:

-MachineInfo

Displays information about the Active Directory machine object.

-DCInfo

Displays information about the domain controller. The default displays DC certificates without verification.

```
Windows Command Prompt

Certutil [options] -DCInfo [Domain] [Verify | DeleteBad | DeleteAll]
```

- Modifiers:
 - Verify
 - o DeleteBad
 - o DeleteAll

```
Windows Command Prompt

[-f] [-user] [-urlfetch] [-dc DCName] [-t Timeout]
```

∏ Tip

The ability to specify an Active Directory Domain Services (AD DS) domain [Domain] and to specify a domain controller (-dc) was added in Windows Server 2012. To successfully run the command, you must use an account that is a member of Domain Admins or Enterprise Admins. The behavior modifications of this command are as follows:

- If a domain is not specified and a specific domain controller is not specified, this option returns a list of domain controllers to process from the default domain controller.
- If a domain is not specified, but a domain controller is specified, a report of the certificates on the specified domain controller is generated.
- If a domain is specified, but a domain controller is not specified, a list of domain controllers is generated along with reports on the certificates for each domain controller in the list.
- If the domain and domain controller are specified, a list of domain controllers is generated from the targeted domain controller. A report of the certificates for each domain controller in the list is also generated.

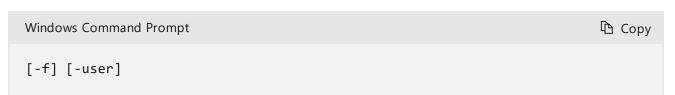

For example, assume there is a domain named CPANDL with a domain controller named CPANDL-DC1. You can run the following command to a retrieve a list of domain controllers and their certificates from CPANDL-DC1: certutil -dc cpandl-dc1 -DCInfo cpandl.

-EntInfo

Displays information about an enterprise Certificate Authority.

Options:

-TCAInfo

Displays information about the Certificate Authority.

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-urlfetch] [-dc DCName] [-t Timeout]
```

-SCInfo

Displays information about the smart card.

Where:

• CRYPT_DELETEKEYSET deletes all keys on the smart card.

Options:

```
Windows Command Prompt

[-Silent] [-split] [-urlfetch] [-t Timeout]
```

-SCRoots

Manages smart card root certificates.

```
Windows Command Prompt

certutil [options] -SCRoots update [+][InputRootFile] [ReaderName]
certutil [options] -SCRoots save @OutputRootFile [ReaderName]
certutil [options] -SCRoots view [InputRootFile | ReaderName]
certutil [options] -SCRoots delete [ReaderName]
```

Options:

```
Windows Command Prompt

[-f] [-split] [-p Password]
```

-key

Lists the keys stored in a key container.

```
Windows Command Prompt

certutil [options] -key [KeyContainerName | -]
```

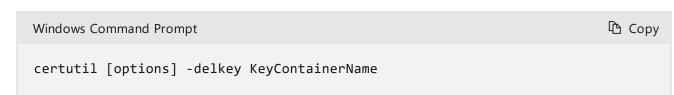

Where:

- **KeyContainerName** is the key container name for the key to verify. This option defaults to machine keys. To switch to user keys, use -user.
- Using the sign refers to using the default key container.

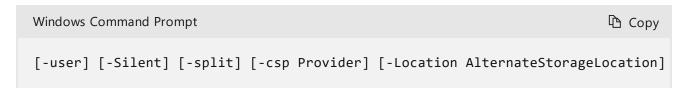

-delkey

Deletes the named key container.

Options:

-DeleteHelloContainer

Deletes the Windows Hello container, removing all associated credentials that are stored on the device, including any WebAuthn and FIDO credentials.

Users need to sign out after using this option for it to complete.

```
Windows Command Prompt

certutil [options] -DeleteHelloContainer
```

-verifykeys

Verifies a public or private key set.

```
Windows Command Prompt

certutil [options] -verifykeys [KeyContainerName CACertFile]
```

Where:

- **KeyContainerName** is the key container name for the key to verify. This option defaults to machine keys. To switch to user keys, use -user.
- CACertFile signs or encrypts certificate files.

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-config Machine\CAName]
```

Remarks

- If no arguments are specified, each signing CA certificate is verified against its private key.
- This operation can only be performed against a local CA or local keys.

-verify

Verifies a certificate, certificate revocation list (CRL), or certificate chain.

```
Windows Command Prompt

certutil [options] -verify CertFile [ApplicationPolicyList | - [IssuancePolicyLicertutil [options] -verify CertFile [CACertFile [CrossedCACertFile]] certutil [options] -verify CRLFile CACertFile [IssuedCertFile] certutil [options] -verify CRLFile CACertFile [DeltaCRLFile]
```

Where:

- CertFile is the name of the certificate to verify.
- ApplicationPolicyList is the optional comma-separated list of required Application Policy ObjectIds.
- **IssuancePolicyList** is the optional comma-separated list of required Issuance Policy ObjectIds.
- CACertFile is the optional issuing CA certificate to verify against.
- CrossedCACertFile is the optional certificate cross-certified by CertFile.
- CRLFile is the CRL file used to verify the CACertFile.
- **IssuedCertFile** is the optional issued certificate covered by the CRLfile.
- DeltaCRLFile is the optional delta CRL file.
- Modifiers:
 - Strong Strong signature verification
 - MSRoot Must chain to a Microsoft root
 - MSTestRoot Must chain to a Microsoft test root
 - AppRoot Must chain to a Microsoft application root
 - EV Enforce Extended Validation Policy

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-Silent] [-split] [-urlfetch] [-t Timeout] [-sslpoli
```

Remarks

- Using **ApplicationPolicyList** restricts chain building to only chains valid for the specified Application Policies.
- Using IssuancePolicyList restricts chain building to only chains valid for the specified Issuance Policies.
- Using CACertFile verifies the fields in the file against CertFile or CRLfile.
- If CACertFile isn't specified, the full chain is built and verified against CertFile.
- If CACertFile and CrossedCACertFile are both specified, the fields in both files are verified against CertFile.
- Using IssuedCertFile verifies the fields in the file against CRLfile.
- Using **DeltaCRLFile** verifies the fields in the file against **CertFile**.

-verifyCTL

Verifies the AuthRoot or Disallowed Certificates CTL.

```
Windows Command Prompt

Certutil [options] -verifyCTL CTLobject [CertDir] [CertFile]
```

- CTLObject identifies the CTL to verify, including:
 - AuthRootWU reads the AuthRoot CAB and matching certificates from the URL cache.
 Use -f to download from Windows Update instead.

- o **DisallowedWU** reads the Disallowed Certificates CAB and disallowed certificate store file from the URL cache. Use -f to download from Windows Update instead.
 - PinRulesWU reads the PinRules CAB from the URL cache. Use -f to download from Windows Update instead.
- AuthRoot reads the registry-cached AuthRoot CTL. Use with _-f and an untrusted
 CertFile to force the registry cached AuthRoot and Disallowed Certificate CTLs to update.
- Disallowed reads the registry-cached Disallowed Certificates CTL. Use with -f and an untrusted CertFile to force the registry cached AuthRoot and Disallowed Certificate CTLs to update.
 - **PinRules** reads the registry cached PinRules CTL. Using -f has the same behavior as with **PinRulesWU**.
- o CTLFileName specifies the file or http path to the CTL or CAB file.
- CertDir specifies the folder containing certificates matching the CTL entries. Defaults to
 the same folder or website as the CTLobject. Using an http folder path requires a path
 separator at the end. If you don't specify AuthRoot or Disallowed, multiple locations are
 searched for matching certificates, including local certificate stores, crypt32.dll resources
 and the local URL cache. Use -f to download from Windows Update, as needed.
- **CertFile** specifies the certificate(s) to verify. Certificates are matched against CTL entries, displaying the results. This option suppresses most of the default output.

-syncWithWU

Syncs certificates with Windows Update.

```
Windows Command Prompt

Certutil [options] -syncWithWU DestinationDir
```

Where:

- **DestinationDir** is the specified directory.
- **f** forces an overwrite.
- Unicode writes redirected output in Unicode.
- gmt displays times as GMT.
- seconds displays times with seconds and milliseconds.
- **v** is a verbose operation.
- PIN is the Smart Card PIN.
- WELL_KNOWN_SID_TYPE is a numeric SID:
 - o 22 Local System
 - o 23 Local Service
 - o 24 Network Service

Remarks

The following files are downloaded by using the automatic update mechanism:

- authrootstl.cab contains the CTLs of non-Microsoft root certificates.
 - disallowedcertstl.cab contains the CTLs of untrusted certificates.
 - disallowedcert.sst contains the serialized certificate store, including the untrusted certificates.

• thumbprint.crt contains the non-Microsoft root certificates.

For example, certutil -syncWithWU \\server1\PKI\CTLs.

- If you use a nonexistent local path or folder as the destination folder, you see the error:
 The system can't find the file specified. 0x80070002 (WIN32: 2
 ERROR_FILE_NOT_FOUND)
- If you use a nonexistent or unavailable network location as the destination folder, you see the error: The network name can't be found. 0x80070043 (WIN32: 67 ERROR BAD NET NAME)
- If your server can't connect over TCP port 80 to Microsoft Automatic Update servers, you receive the following error: A connection with the server couldn't be established 0x80072efd (INet: 12029 ERROR_INTERNET_CANNOT_CONNECT)
- If your server is unable to reach the Microsoft Automatic Update servers with the DNS
 name ctldl.windowsupdate.com, you receive the following error: The server name or
 address couldn't be resolved 0x80072ee7 (INet: 12007
 ERROR_INTERNET_NAME_NOT_RESOLVED).
- If you don't use the -f switch, and any of the CTL files already exist in the directory, you receive a file exists error: certutil: -syncWithWU command FAILED: 0x800700b7 (WIN32/HTTP: 183 ERROR_ALREADY_EXISTS) Certutil: Can't create a file when that file already exists.
- If there's a change in the trusted root certificates, you see: Warning! Encountered the following no longer trusted roots: <folder path>\<thumbprint>.crt. Use "-f" option to force the delete of the above ".crt" files. Was "authrootstl.cab" updated? If yes, consider deferring the delete until all clients have been updated.

Options:

```
Windows Command Prompt

[-f] [-Unicode] [-gmt] [-seconds] [-v] [-privatekey] [-pin PIN] [-sid WELL_KNOWN
```

-generateSSTFromWU

Generates a store file that is synced with Windows Update.

```
Windows Command Prompt

Certutil [options] -generateSSTFromWU SSTFile
```

Where:

• **SSTFile** is the .sst file to be generated that contains the Third Party Roots downloaded from Windows Update.

Options:

-generatePinRulesCTL

Generates a Certificate Trust List (CTL) file that contains a list of pinning rules.

Windows Command Prompt

Certutil [options] -generatePinRulesCTL XMLFile CTLFile [SSTFile [QueryFilesPref

Where:

- XMLFile is the input XML file to be parsed.
- CTLFile is the output CTL file to be generated.
- **SSTFile** is the optional *.sst* file to be created that contains all of the certificates used for pinning.
- QueryFilesPrefix are optional Domains.csv and Keys.csv files to be created for database query.
 - The QueryFilesPrefix string is prepended to each created file.
 - o The **Domains.csv** file contains rule name, domain rows.
 - The Keys.csv file contains rule name, key SHA256 thumbprint rows.

Options:

-downloadOcsp

Downloads the OCSP responses and writes to the directory.

```
Windows Command Prompt

Certutil [options] -downloadOcsp CertificateDir OcspDir [ThreadCount] [Modifiers
```

Where:

- CertificateDir is the directory of a certificate, store and PFX files.
- OcspDir is the directory to write OCSP responses.
- ThreadCount is the optional maximum number of threads for concurrent downloading.
 Default is 10.
- Modifiers are comma separated list of one or more of the following:
 - o DownloadOnce Downloads once and exits.
 - o ReadOcsp Reads from OcspDir instead of writing.

-generateHpkpHeader

Generates the HPKP header using certificates in a specified file or directory.

```
Windows Command Prompt

Certutil [options] -generateHpkpHeader CertFileOrDir MaxAge [ReportUri] [Modified]
```

Where:

- CertFileOrDir is the file or directory of certificates, which is the source of pin-sha256.
- MaxAge is the max-age value in seconds.
- **ReportUri** is the optional report-uri.
- Modifiers are comma separated list of one or more of the following:
 - o includeSubDomains Appends the includeSubDomains.

-flushCache

Flushes the specified caches in selected process, such as, Isass.exe.

```
Windows Command Prompt

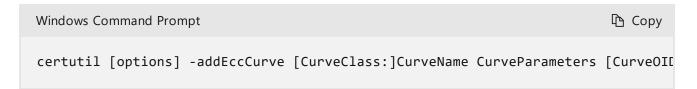

Certutil [options] -flushCache ProcessId CacheMask [Modifiers]
```

Where:

- **ProcessId** is the numeric ID of a process to flush. Set to **0** to flush all processes where flush is enabled.
- CacheMask is the bit mask of caches to be flushed either numeric or the following bits:
 - **0**: ShowOnly
 - 0x01: CERT_WNF_FLUSH_CACHE_REVOCATION
 - 0x02: CERT_WNF_FLUSH_CACHE_OFFLINE_URL
 - o 0x04: CERT_WNF_FLUSH_CACHE_MACHINE_CHAIN_ENGINE
 - 0x08: CERT_WNF_FLUSH_CACHE_USER_CHAIN_ENGINES
 - 0x10: CERT_WNF_FLUSH_CACHE_SERIAL_CHAIN_CERTS
 - 0x20: CERT_WNF_FLUSH_CACHE_SSL_TIME_CERTS
 - 0x40: CERT_WNF_FLUSH_CACHE_OCSP_STAPLING
- Modifiers are comma separated list of one or more of the following:
 - Show Shows the caches being flushed. Certutil must be explicitly terminated.

-addEccCurve

Adds an ECC Curve.

Where:

- Curve Class is the ECC Curve Class type:
 - WEIERSTRASS (Default)
 - MONTGOMERY
 - TWISTED_EDWARDS
- CurveName is the ECC Curve name.
- CurveParameters are one of the following:
 - A certificate filename containing ASN encoded parameters.
 - A file containing ASN encoded parameters.
- CurveOID is the ECC Curve OID and is one of the following:
 - A certificate filename containing an ASN encoded OID.
 - An explicit ECC Curve OID.
- CurveType is the Schannel ECC NamedCurve point (numeric).

Options:

-deleteEccCurve

Deletes the ECC Curve.

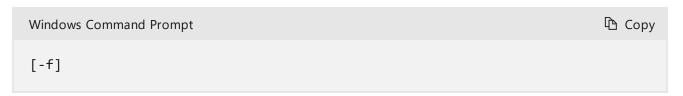

Windows Command Prompt © Copy

certutil [options] -deleteEccCurve CurveName | CurveOID

Where:

- CurveName is the ECC Curve name.
- CurveOID is the ECC Curve OID.

Options:

-displayEccCurve

Displays the ECC Curve.

```
Windows Command Prompt

Certutil [options] -displayEccCurve [CurveName | CurveOID]
```

Where:

- CurveName is the ECC Curve name.
- CurveOID is the ECC Curve OID.

Options:

-csplist

Lists the cryptographic service providers (CSPs) installed on this machine for cryptographic operations.

Options:

-csptest

Tests the CSPs installed on this machine.

Windows Command Prompt	🖺 Сору
certutil [options] -csptest [Algorithm]	

Options:

Windows Command Prompt

© Copy

```
[-user] [-Silent] [-csp Provider]
```

-CNGConfig

Displays CNG cryptographic configuration on this machine.

```
Windows Command Prompt

certutil [options] -CNGConfig

Options:

Windows Command Prompt

Copy
```

-sign

[-Silent]

Re-signs a certificate revocation list (CRL) or certificate.

```
Windows Command Prompt

certutil [options] -sign InFileList | SerialNumber | CRL OutFileList [StartDate certutil [options] -sign InFileList | SerialNumber | CRL OutFileList [#HashAlgor certutil [options] -sign InFileList OutFileList [Subject:CN=...] [Issuer:hex dat
```

- InFileList is the comma-separated list of certificate or CRL files to modify and re-sign.
- **SerialNumber** is the serial number of the certificate to create. The validity period and other options can't be present.
- CRL creates an empty CRL. The validity period and other options can't be present.
- OutFileList is the comma-separated list of modified certificate or CRL output files. The number of files must match infilelist.
- StartDate+dd:hh is the new validity period for the certificate or CRL files, including:
 - o optional date plus
 - optional days and hours validity period If multiple fields are used, use a (+) or (-) separator. Use now[+dd:hh] to start at the current time. Use now-dd:hh+dd:hh to start at a fixed offset from the current time and a fixed validity period. Use never to have no expiration date (for CRLs only).
- **SerialNumberList** is the comma-separated serial number list of the files to add or remove.
- ObjectIdList is the comma-separated extension ObjectId list of the files to remove.
- @ExtensionFile is the INF file that contains the extensions to update or remove. For example:

```
Windows Command Prompt

[Extensions]

2.5.29.31 = ; Remove CRL Distribution Points extension

2.5.29.15 = {hex} ; Update Key Usage extension

_continue_=03 02 01 86
```

- **HashAlgorithm** is the name of the hash algorithm. This must only be the text preceded by the # sign.
- AlternateSignatureAlgorithm is the alternate signature algorithm specifier.

Options:

```
Windows Command Prompt

[-nullsign] [-f] [-user] [-Silent] [-Cert CertId] [-csp Provider]
```

Remarks

- Using the minus sign (-) removes serial numbers and extensions.
- Using the plus sign (+) adds serial numbers to a CRL.
- You can use a list to remove both serial numbers and ObjectIds from a CRL at the same time
- Using the minus sign before **AlternateSignatureAlgorithm** allows you to use the legacy signature format.
- Using the plus sign allows you to use the alternate signature format.
- If you don't specify **AlternateSignatureAlgorithm**, the signature format in the certificate or CRL is used.

-vroot

Creates or deletes web virtual roots and file shares.

```
Windows Command Prompt

Certutil [options] -vroot [delete]
```

-vocsproot

Creates or deletes web virtual roots for an OCSP web proxy.

```
Windows Command Prompt

Certutil [options] -vocsproot [delete]
```

-addEnrollmentServer

Adds an Enrollment Server application and application pool if necessary for the specified Certificate Authority. This command doesn't install binaries or packages.

```
Windows Command Prompt

Certutil [options] -addEnrollmentServer Kerberos | UserName | ClientCertificate
```

- addEnrollmentServer requires you to use an authentication method for the client connection to the Certificate Enrollment Server, including:
 - o Kerberos uses Kerberos SSL credentials.
 - UserName uses named account for SSL credentials.
 - ClientCertificate uses X.509 Certificate SSL credentials.
- Modifiers:
 - AllowRenewalsOnly allows only renewal request submissions to the Certificate Authority through the URL.

 AllowKeyBasedRenewal allows use of a certificate with no associated account in Active Directory. This applies when used with ClientCertificate and AllowRenewalsOnly mode.

Options:

-deleteEnrollmentServer

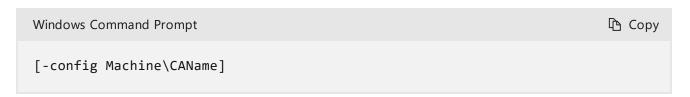

Deletes an Enrollment Server application and application pool if necessary for the specified Certificate Authority. This command doesn't install binaries or packages.

Where:

- deleteEnrollmentServer requires you to use an authentication method for the client connection to the Certificate Enrollment Server, including:
 - Kerberos uses Kerberos SSL credentials.
 - UserName uses named account for SSL credentials.
 - o ClientCertificate uses X.509 Certificate SSL credentials.

Options:

-addPolicyServer

Add a Policy Server application and application pool, if necessary. This command doesn't install binaries or packages.

Where:

- addPolicyServer requires you to use an authentication method for the client connection to the Certificate Policy Server, including:
 - o Kerberos uses Kerberos SSL credentials.
 - UserName uses named account for SSL credentials.
 - ClientCertificate uses X.509 Certificate SSL credentials.
- KeyBasedRenewal allows use of policies returned to the client containing keybasedrenewal templates. This option applies only for UserName and ClientCertificate authentication.

-deletePolicyServer

Windows Command Prompt

Deletes a Policy Server application and application pool, if necessary. This command doesn't remove binaries or packages.

Сору

```
certutil [options] -deletePolicyServer Kerberos | UserName | ClientCertificate [
```

Where:

- **deletePolicyServer** requires you to use an authentication method for the client connection to the Certificate Policy Server, including:
 - Kerberos uses Kerberos SSL credentials.
 - UserName uses named account for SSL credentials.
 - ClientCertificate uses X.509 Certificate SSL credentials.
- KeyBasedRenewal allows use of a KeyBasedRenewal policy server.

-Class

Displays COM registry information.

```
Windows Command Prompt

Certutil [options] -Class [ClassId | ProgId | DllName | *]
```

Options:

```
Windows Command Prompt

[-f]

Copy
```

-7f

Checks certificate for 0x7f length encodings.

```
Windows Command Prompt

Certutil [options] -7f CertFile
```

-oid

Displays the object identifier or sets a display name.

```
Windows Command Prompt

certutil [options] -oid ObjectId [DisplayName | delete [LanguageId [type]]]
certutil [options] -oid GroupId
certutil [options] -oid AlgId | AlgorithmName [GroupId]
```

- ObjectId is the ID to be displayed or to add to the display name.
- GroupId is the GroupID number (decimal) that ObjectIds enumerate.
- AlgId is the hexadecimal ID that objectID looks up.
- AlgorithmName is the algorithm name that objectID looks up.
- **DisplayName** displays the name to store in DS.
- Delete deletes the display name.
- LanguageId is the language ID value (defaults to current: 1033).
- Type is the type of DS object to create, including:
 - o 1 Template (default)
 - o 2 Issuance Policy
 - o 3 Application Policy
- -f creates a DS object.

Options:

-error

Displays the message text associated with an error code.

-getsmtpinfo

Gets Simple Mail Transfer Protocol (SMTP) information.

```
Windows Command Prompt

Certutil [options] -getsmtpinfo
```

-setsmtpinfo

Sets SMTP information.

```
Windows Command Prompt

certutil [options] -setsmtpinfo LogonName
```

Options:

```
Windows Command Prompt

[-config Machine\CAName] [-p Password]
```

-getreg

Displays a registry value.

```
Windows Command Prompt

Certutil [options] -getreg [{ca | restore | policy | exit | template | enroll |
```

- ca uses a Certificate Authority's registry key.
- restore uses Certificate Authority's restore registry key.
- policy uses the policy module's registry key.
- exit uses the first exit module's registry key.
- template uses the template registry key (use -user for user templates).
- enroll uses the enrollment registry key (use -user for user context).
- chain uses the chain configuration registry key.
- PolicyServers uses the Policy Servers registry key.
- **ProgId** uses the policy or exit module's ProgID (registry subkey name).
- RegistryValueName uses the registry value name (use Name* to prefix match).
- value uses the new numeric, string or date registry value or filename. If a numeric value starts with + or -, the bits specified in the new value are set or cleared in the existing

registry value.

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-config Machine\CAName]
```

Remarks

- If a string value starts with + or -, and the existing value is a REG_MULTI_SZ value, the string is added to or removed from the existing registry value. To force creation of a REG_MULTI_SZ value, add \n to the end of the string value.
- If the value starts with \@, the rest of the value is the name of the file containing the hexadecimal text representation of a binary value.
- If it doesn't refer to a valid file, it's instead parsed as <code>[Date][+|-][dd:hh]</code> which is an optional date plus or minus optional days and hours.
- If both are specified, use a plus sign (+) or minus sign (-) separator. Use now+dd:hh for a date relative to the current time.
- Use i64 as a suffix to create a REG_QWORD value.
- Use chain\chaincacheresyncfiletime @now to effectively flush cached CRLs.
- Registry aliases:
 - Config
 - o CA
 - o Policy PolicyModules
 - Exit ExitModules
 - o Restore RestoreInProgress
 - Template Software\Microsoft\Cryptography\CertificateTemplateCache
 - Enroll Software\Microsoft\Cryptography\AutoEnrollment
 (Software\Policies\Microsoft\Cryptography\AutoEnrollment)
 - MSCEP Software\Microsoft\Cryptography\MSCEP
 - Chain Software\Microsoft\Cryptography\OID\EncodingType
 0\CertDllCreateCertificateChainEngine\Config
 - PolicyServers Software\Microsoft\Cryptography\PolicyServers
 (Software\Policies\Microsoft\Cryptography\PolicyServers)
 - Crypt32 System\CurrentControlSet\Services\crypt32
 - NGC System\CurrentControlSet\Control\Cryptography\Ngc
 - AutoUpdate Software\Microsoft\SystemCertificates\AuthRoot\AutoUpdate
 - Passport Software\Policies\Microsoft\PassportForWork
 - MDM Software\Microsoft\Policies\PassportForWork

-setreg

Sets a registry value.

```
Windows Command Prompt

Certutil [options] -setreg [{ca | restore | policy | exit | template | enroll |
```

- ca uses a Certificate Authority's registry key.
- restore uses Certificate Authority's restore registry key.
- policy uses the policy module's registry key.
- exit uses the first exit module's registry key.
- template uses the template registry key (use -user for user templates).
- **enroll** uses the enrollment registry key (use -user for user context).
- chain uses the chain configuration registry key.

- PolicyServers uses the Policy Servers registry key.
- **Progld** uses the policy or exit module's ProgID (registry subkey name).
- RegistryValueName uses the registry value name (use Name* to prefix match).
- Value uses the new numeric, string or date registry value or filename. If a numeric value starts with + or -, the bits specified in the new value are set or cleared in the existing registry value.

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-config Machine\CAName]
```

Remarks

- If a string value starts with + or -, and the existing value is a REG_MULTI_SZ value, the string is added to or removed from the existing registry value. To force creation of a REG_MULTI_SZ value, add \n to the end of the string value.
- If the value starts with \@, the rest of the value is the name of the file containing the hexadecimal text representation of a binary value.
- If it doesn't refer to a valid file, it's instead parsed as <code>[Date][+|-][dd:hh]</code> which is an optional date plus or minus optional days and hours.
- If both are specified, use a plus sign (+) or minus sign (-) separator. Use now+dd:hh for a date relative to the current time.
- Use i64 as a suffix to create a REG_QWORD value.
- Use chain\chaincacheresyncfiletime @now to effectively flush cached CRLs.

-delreg

Deletes a registry value.

```
Windows Command Prompt

Certutil [options] -delreg [{ca | restore | policy | exit | template | enroll | certutil | certut
```

Where:

- ca uses a Certificate Authority's registry key.
- restore uses Certificate Authority's restore registry key.
- policy uses the policy module's registry key.
- exit uses the first exit module's registry key.
- **template** uses the template registry key (use -user for user templates).
- enroll uses the enrollment registry key (use -user for user context).
- chain uses the chain configuration registry key.
- PolicyServers uses the Policy Servers registry key.
- Progld uses the policy or exit module's ProgID (registry subkey name).
- RegistryValueName uses the registry value name (use Name* to prefix match).
- Value uses the new numeric, string or date registry value or filename. If a numeric value starts with + or -, the bits specified in the new value are set or cleared in the existing registry value.

Options:

```
Windows Command Prompt

[-f] [-Enterprise] [-user] [-GroupPolicy] [-config Machine\CAName]
```

Remarks

- If a string value starts with + or -, and the existing value is a REG_MULTI_SZ value, the string is added to or removed from the existing registry value. To force creation of a REG_MULTI_SZ value, add \n to the end of the string value.
- If the value starts with \@, the rest of the value is the name of the file containing the hexadecimal text representation of a binary value.
- If it doesn't refer to a valid file, it's instead parsed as <code>[Date][+|-][dd:hh]</code> which is an optional date plus or minus optional days and hours.
- If both are specified, use a plus sign (+) or minus sign (-) separator. Use now+dd:hh for a date relative to the current time.
- Use i64 as a suffix to create a REG_QWORD value.
- Use chain\chaincacheresyncfiletime @now to effectively flush cached CRLs.
- Registry aliases:
 - Config
 - o CA
 - Policy PolicyModules
 - Exit ExitModules
 - Restore RestoreInProgress
 - Template Software\Microsoft\Cryptography\CertificateTemplateCache
 - Enroll Software\Microsoft\Cryptography\AutoEnrollment
 (Software\Policies\Microsoft\Cryptography\AutoEnrollment)
 - MSCEP Software\Microsoft\Cryptography\MSCEP
 - Chain Software\Microsoft\Cryptography\OID\EncodingType
 0\CertDllCreateCertificateChainEngine\Config
 - PolicyServers Software\Microsoft\Cryptography\PolicyServers
 (Software\Policies\Microsoft\Cryptography\PolicyServers)
 - Crypt32 System\CurrentControlSet\Services\crypt32
 - NGC System\CurrentControlSet\Control\Cryptography\Ngc
 - AutoUpdate Software\Microsoft\SystemCertificates\AuthRoot\AutoUpdate
 - Passport Software\Policies\Microsoft\PassportForWork
 - MDM Software\Microsoft\Policies\PassportForWork

-importKMS

Imports user keys and certificates into the server database for key archival.

```
Windows Command Prompt

Certutil [options] -importKMS UserKeyAndCertFile [CertId]
```

Where:

- **UserKeyAndCertFile** is a data file with user private keys and certificates that are to be archived. This file can be:
 - An Exchange Key Management Server (KMS) export file.
 - o A PFX file.
- **CertId** is a KMS export file decryption certificate match token. For more information, see the -store parameter in this article.
- -f imports certificates not issued by the Certificate Authority.

Options:

```
Windows Command Prompt

[-f] [-Silent] [-split] [-config Machine\CAName] [-p Password] [-symkeyalg Symme
```

-ImportCert

Imports a certificate file into the database.

```
Windows Command Prompt

Certutil [options] -ImportCert Certfile [ExistingRow]
```

Where:

- Existing Row imports the certificate in place of a pending request for the same key.
- -f imports certificates not issued by the Certificate Authority.

Options:

```
Windows Command Prompt

[-f] [-config Machine\CAName]
```

Remarks

The Certificate Authority may also need to be configured to support foreign certificates by running certuiil -setreg ca\KRAFlags +KRAF_ENABLEFOREIGN.

-GetKey

Retrieves an archived private key recovery blob, generates a recovery script, or recovers archived keys.

```
Windows Command Prompt

certutil [options] -GetKey SearchToken [RecoveryBlobOutFile]
certutil [options] -GetKey SearchToken script OutputScriptFile
certutil [options] -GetKey SearchToken retrieve | recover OutputFileBaseName
```

Where:

- **script** generates a script to retrieve and recover keys (default behavior if multiple matching recovery candidates are found, or if the output file isn't specified).
- retrieve retrieves one or more Key Recovery Blobs (default behavior if exactly one matching recovery candidate is found, and if the output file is specified). Using this option truncates any extension and appends the certificate-specific string and the .rec extension for each key recovery blob. Each file contains a certificate chain and an associated private key, still encrypted to one or more Key Recovery Agent certificates.
- recover retrieves and recovers private keys in one step (requires Key Recovery Agent certificates and private keys). Using this option truncates any extension and appends the
 .p12 extension. Each file contains the recovered certificate chains and associated private keys, stored as a PFX file.
- SearchToken selects the keys and certificates to be recovered, including:
 - o Certificate Common Name
 - Certificate Serial Number
 - Certificate SHA-1 hash (thumbprint)
 - o Certificate Keyld SHA-1 hash (Subject Key Identifier)
 - Requester Name (domain\user)
 - UPN (user@domain)
- **RecoveryBlobOutFile** outputs a file with a certificate chain and an associated private key, still encrypted to one or more Key Recovery Agent certificates.
- OutputScriptFile outputs a file with a batch script to retrieve and recover private keys.
- OutputFileBaseName outputs a file base name.

Options:

```
Windows Command Prompt

[-f] [-UnicodeText] [-Silent] [-config Machine\CAName] [-p Password] [-ProtectTo
```

Remarks

- For **retrieve**, any extension is truncated and a certificate-specific string and the .rec extensions are appended for each key recovery blob. Each file contains a certificate chain and an associated private key, still encrypted to one or more Key Recovery Agent certificates.
- For **recover**, any extension is truncated and the .p12 extension is appended. Contains the recovered certificate chains and associated private keys, stored as a PFX file.

-RecoverKey

Recovers an archived private key.

```
Windows Command Prompt

Certutil [options] -RecoverKey RecoveryBlobInFile [PFXOutFile [RecipientIndex]]
```

Options:

```
Windows Command Prompt

[-f] [-user] [-Silent] [-p Password] [-ProtectTo SAMNameAndSIDList] [-c
```

-mergePFX

Merges PFX files.

```
Windows Command Prompt

certutil [options] -MergePFX PFXInFileList PFXOutFile [Modifiers]
```

Where:

- PFXInFileList is a comma-separated list of PFX input files.
- **PFXOutFile** is the name of the PFX output file.
- Modifiers are comma separated lists of one or more of the following:
 - ExtendedProperties includes any extended properties.
 - **NoEncryptCert** specifies to not encrypt the certificates.
 - EncryptCert specifies to encrypt the certificates.

Options:

```
Windows Command Prompt

[-f] [-user] [-split] [-p password] [-ProtectTo SAMNameAndSIDList] [-csp Provide
```

Remarks

- The password specified on the command line must be a comma-separated password list.
- If more than one password is specified, the last password is used for the output file. If
 only one password is provided or if the last password is *, the user is prompted for the
 output file password.

-convertEPF

Converts a PFX file into an EPF file.

```
Windows Command Prompt

Certutil [options] -ConvertEPF PFXInFileList EPFOutFile [cast | cast-] [V3CACert
```

Where:

- PFXInFileList is a comma-separated list of PFX input files.
- EPFOutFile is the name of the PFX output file.
- EPF is the name of the EPF output file.
- cast uses CAST 64 encryption.
- cast- uses CAST 64 encryption (export).
- V3CACertId is the V3 CA certificate match token. For more information, see the parameter in this article.
- Salt is the EPF output file salt string.

Options:

```
Windows Command Prompt

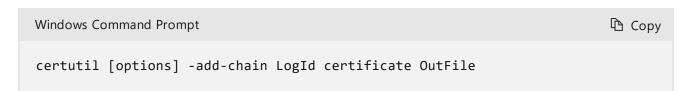

[-f] [-Silent] [-dc DCName] [-p Password] [-csp Provider]
```

Remarks

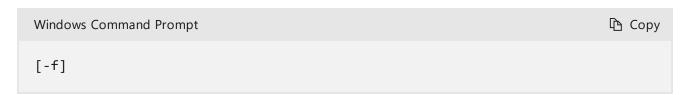

- The password specified on the command line must be a comma-separated password list.
- If more than one password is specified, the last password is used for the output file. If only one password is provided or if the last password is *, the user is prompted for the output file password.

-add-chain

Adds a certificate chain.

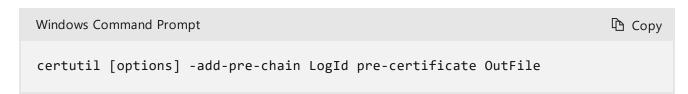

Options:

-add-pre-chain

Adds a pre-certificate chain.

Options:

Windows Command Prompt

[-f]

-get-sth

Gets a signed tree head.

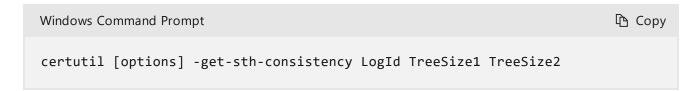

Windows Command Prompt	🖺 Сору
certutil [options] -get-sth [LogId]	

Options:

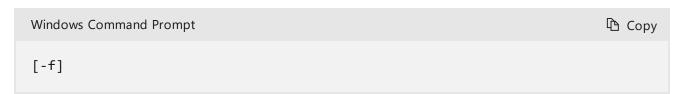

Windows Command Prompt	🖒 Сору
[-f]	

-get-sth-consistency

Gets signed tree head changes.

Options:

-get-proof-by-hash

Gets proof of a hash from a timestamp server.

Options:

-get-entries

Retrieves entries from an event log.

Windows Command Prompt	ြ Сору
certutil [options] -get-entries LogId FirstIndex LastIndex	

Options:

Windows Command Prompt	🖺 Сору
[-f]	

-get-roots

Retrieves the root certificates from the certificate store.

```
Windows Command Prompt

certutil [options] -get-roots LogId
```

Options:

```
Windows Command Prompt

[-f]
```

-get-entry-and-proof

Retrieves an event log entry and its cryptographic proof.

```
Windows Command Prompt

Certutil [options] -get-entry-and-proof LogId Index [TreeSize]
```

Options:

```
Windows Command Prompt

[-f]
```

-VerifyCT

Verifies a certificate against the Certificate Transparency log.

```
Windows Command Prompt

Certutil [options] -VerifyCT Certificate SCT [precert]
```

Options:

```
Windows Command Prompt

[-f]
```

-?

Displays the list of parameters.

```
Windows Command Prompt

certutil -?
certutil <name_of_parameter> -?
certutil -? -v
```

Where:

- -? displays the list of parameters
- -<name_of_parameter> -? displays help content for the specified parameter.
- -? -v displays a verbose list of parameters and options.

Options

This section defines all of the options you're able to specify, based on the command. Each parameter includes information about which options are valid for use.

Expand table

Option	Description
-admin	Use ICertAdmin2 for CA properties.
-anonymous	Use anonymous SSL credentials.
-cert CertId	Signing certificate.
-clientcertificate clientCertId	Use X.509 Certificate SSL credentials. For selection UI, use - clientcertificate.
-config Machine\CAName	Certificate Authority and computer name string.
-csp provider	Provider: KSP - Microsoft Software Key Storage Provider TPM - Microsoft Platform Crypto Provider NGC - Microsoft Passport Key Storage Provider SC - Microsoft Smart Card Key Storage Provider
-dc DCName	Target a specific Domain Controller.
-enterprise	Use the local machine enterprise registry certificate store.
-f	Force overwrite.
-generateSSTFromWU SSTFile	Generate SST by using the automatic update mechanism.
-gmt	Display times using GMT.
-GroupPolicy	Use the group policy certificate store.
-idispatch	Use IDispatch instead of COM native methods.
-kerberos	Use Kerberos SSL credentials.
-location alternatestoragelocation	(-loc) AlternateStorageLocation.
-mt	Display machine templates.
-nocr	Encode text without CR characters.
-nocrlf	Encode text without CR-LF characters.
-nullsign	Use the hash of the data as a signature.
-oldpfx	Use old PFX encryption.
-out columnlist	Comma-separated column list.
-p password	Password
-pin PIN	Smart card PIN.
-policyserver URLorID	Policy Server URL or ID. For selection U/I, use -policyserver. For all Policy Servers, use -policyserver *
-privatekey	Display password and private key data.
-protect	Protect keys with password.
-protectto SAMnameandSIDlist	Comma-separated SAM name/SID list.
-restrict restrictionlist	Comma-separated Restriction List. Each restriction consists of a column name, a relational operator, and a constant integer, string, or date. One column name may be preceded by a plus or minus sign to indicate the sort order. For example: requestID = 47, +requestername >= a, requestername, or -requestername > DOMAIN, Disposition = 21.

-reverse	Reverse Log and Queue columns.
-seconds	Display times using seconds and milliseconds.
-service	Use service certificate store.
-sid	Numeric SID:
	22 - Local System
	23 - Local Service
	24 - Network Service
-silent	Use the silent flag to acquire crypt context.
-split	Split embedded ASN.1 elements, and save to files.
-sslpolicy servername	SSL Policy matching ServerName.
-symkeyalg	Name of the Symmetric Key Algorithm with optional key length.
symmetrickeyalgorithm[,keylength]	For example: AES,128 or 3DES.
-syncWithWU DestinationDir	Sync with Windows Update.
-t timeout	URL fetch timeout in milliseconds.
-Unicode	Write redirected output in Unicode.
-UnicodeText	Write output file in Unicode.
-urlfetch	Retrieve and verify AIA Certs and CDP CRLs.
-user	Use the HKEY_CURRENT_USER keys or certificate store.
-username username	Use named account for SSL credentials. For selection UI, use - username.
-ut	Display user templates.
-V	Provide more detailed (verbose) information.
-v1	Use V1 interfaces.

Hash algorithms: MD2 MD4 MD5 SHA1 SHA256 SHA384 SHA512.
