"FILELESS" UAC BYPASS USING SDCLT.EXE

March 17, 2017 by enigma0x3

Recently, I published a post on using <u>App Paths with sdclt.exe to bypass UAC</u>. You may remember that the App Path bypass required a file on disk. Since sdclt.exe is out there, I figured I would publish another bypass using that binary, only this one is fileless. I mentioned it in my <u>previous post</u>, but the <u>Vault7 leak</u> confirms that bypassing UAC is operationally interesting, even to nation states, as several UAC bypasses/notes were detailed in the dump. As far as public bypasses go, definitely check out the <u>UACME project</u> by <u>@hfiref0x</u>, which has a nice collection of public techniques.

In newer versions of Windows, Microsoft has shown that they are taking the <u>bypasses seriously</u>. This has motivated me to spend a little more time on UAC and the different methods around it.

As some of you may know, there are some Microsoft signed binaries that auto-elevate due to their manifest. You can read more about these binaries and their manifests here. While searching for more of these auto-elevating binaries by using the SysInternals tool "sigcheck", I came across "sdclt.exe" and verified that it auto-elevates due to its manifest:

```
<description>manifest file for sdclt</description>
<dependency>
   <dependentAssembly>
       <assemblyIdentity</pre>
          type~"win32"
name="Microsoft.Windows.Common-Controls"
           version="6.0.0.0"
           processorArchitecture="amd64"
            publicKeyToken="6595b64144ccf1df"
            language="*"
   </dependentAssembly>
</dependency>
<trustInfo xmlns="urn:schemas-microsoft-com:asm.v3">
   <security>
       <requestedPrivileges>
            <requestedExecutionLevel</pre>
                level="requireAdministrator"
                uiAccess="false"
        </requestedPrivileges>
   </security>
</trustInfo>
capplication xmlns="urn:schemas-microsoft-com:asm.v3">
   <windowsSettings>
        <autoElevate xmlns="http://schemas.microsoft.com/SMI/2005/WindowsSettings">true</autoElevate>
    </windowsSettings>
/application>
 /assembly>
```

*Note: This only works on Windows 10. The manifest for sdclt.exe in Windows 7 has the requestedExecutionLevel set to "AsInvoker", preventing auto-elevation when started from medium integrity.

As I mentioned in my <u>last post</u>, a common technique used to investigate loading behavior on Windows is to use <u>SysInternals Process Monitor</u> to analyze how a process behaves when executed. I often work some basic binary analysis into my investigative process in order to see what other opportunities exist.

One of the first things I tend to do when analyzing an auto-elevate binary is to look for any potential command line arguments. I use IDA for this, but you can use your preferred tool. When peering into sdclt.exe, I noticed a few arguments that stood out due to Comment of Reblog Subscribe

                            ?RunBackupWizardProcess@...
                                                                 lea r8, aRestorewizard; "/RESTOREWIZARD"
```

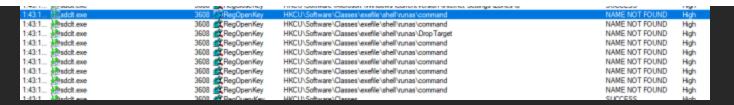

These were interesting as sdclt.exe is set to auto-elevate in its manifest anyway. Looking at sdclt.exe in IDA, it checks if the argument matches "/kickoffelev". If it does, it sets the full path for "sdclt.exe", adds "/KickOffJob" as a parameter and then calls SxShellExecuteWithElevate.

```
💶 🚄
loc_140002B72:
                         ; Str1
                         rcx, [rdi+8]
                         rdx, aKickoffelev ; "/KICKOFFELEU"
                lea
                 call
                 test
                         short loc 140002888
                      r9, aKickoffjob ; "/KICKOFFJOB"
              mov
1ea
                      r8, aSystemrootSy_2; "%systemroot%\\system32\\sdclt.exe"
                      ecx, ecx ; HWND
?SxShellExecuteWithElevate@@YAJPEAUHUND_@@HPEBG1@Z ; SxShellExecuteWithElevate(HWND_ *,int,ushort cons
              call
                      [rsp+0F0h+var_C0], eax
              test
                      short loc 140002881
```

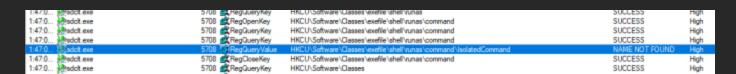

Following that path, SxShellExecuteWithElevate starts "%systemroot%\system32\sdclt.exe /kickoffjob" with the "Runas" <u>verb</u>. This is essentially programmatically executing the "RunAsAdministrator" option when you right-click a binary.

```
📕 🚄 🖼
        [rsp+108h+var E4], ax

        eax, eax
jnz
        short loc 14006D7B6
```

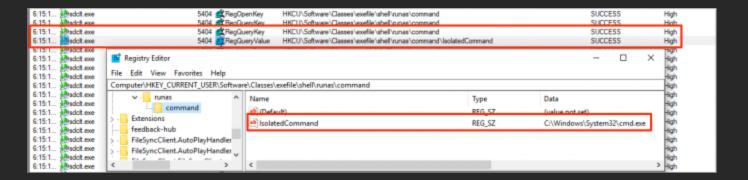

The next step is to run "sdclt.exe /Kickoffelev" with procmon running. After going through the output, we see the trusty "shell\<verb>\command" registry search Comment Comment Subscribe

The next step was to add those keys and see if our binary and parameters of choice would execute. Unfortunately, nothing executed after adding the keys and starting "sdclt.exe /kickoffelev". Looking back in procmon, our keys are queried, but sdclt.exe is actually looking for an additional value within the "command" key: "IsolatedCommand".

We can then add our payload and parameters in a string (REG_SZ) value within the "Command" key called "IsolatedCommand":

This is the same bug (minus the IsolatedCommand portion) that was used in the eventwwr.exe "fileless" UAC bypass. You can read about the eventwwr.exe bypass and the specific registry keys used here. Notice that instead of "shell\open\command", we now see "shell\runas\command". This is because sdclt.exe was invoked (again) using the "RunAs" verb via SxShellExecuteWithElevate.

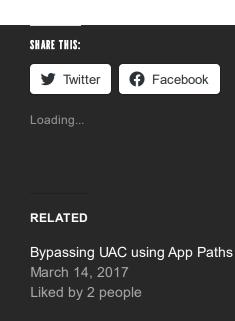

After adding our payload as the "IsolatedCommand" value, running "sdclt.exe /KickOffElev" will execute our payload (and any parameters) in a high-integrity context:

To demonstrate this technique, you can find a script here: https://github.com/enigma0x3/Misc-PowerShell-Stuff/blob/master/lnvoke-SDCLTBypass.ps1

The script takes a full path to your payload and any parameters. "C:\Windows\System32\cmd.exe /c notepad.exe" is a good one to validate. It will automatically add the keys, start "sdclt.exe /kickoffelev" and then cleanup.

This particular technique can be remediated or fixed by setting the UAC level to "Always Notify" or by removing the current user from the Local Administrators group. Further, if you would like to monitor for this attack, you could utilize methods/signatures to look for and alert on new registry entries in HKCU:\Software\Classes\exefile\shell\runas\command\isolatedCommand

Cheers, Matt
