iControlREST (11.5) - execute bash command

I've been playing with iControlREST recently, and trying to port some old iControl scripts over. Most of them work nicely, but I've got one that requires running a bash command (for example purposes, let's say in the tmsh shell, the command would be

```
1   run /util bash -c 'echo "works"'
```

.

Is it possible to run a bash command through iControlREST?

Try this:

```
1   curl -vsk -u 'admin:admin' -H "Content-Type: application/jso
```

You're somewhat limited with what you can do with Bash, for example you couldn't directly execute a binary file like 'ls', but then you could script it and then call the script:
