RunX
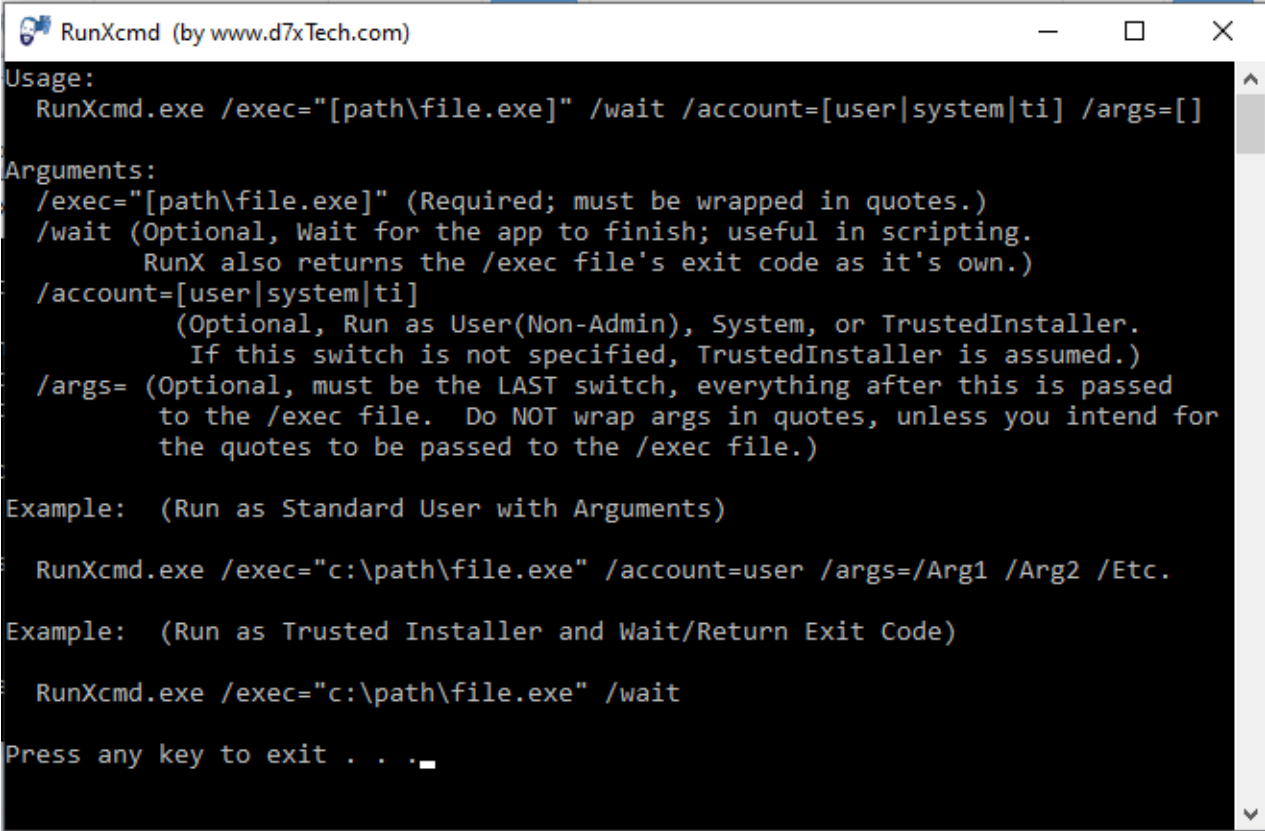

Home ⌐ Free Software ⌐ RunX

Current version: 1.0.0.1 Released May 19th, 2021 *(fixed a bug with launching processes in general d7x code as* explained here*.)*

RunX is designed to easily launch any process with **System** account or **TrustedInstaller** account privileges, in order to bypass file system and registry permissions. It is also designed to optionally pass command line arguments to that app without having to open an administrative console window and navigate to the appropriate path first, and can capture/display the app's exit code. Usage is simple, just drag and drop an executable onto RunX.exe, or launch it normally and browse/type in the path to an executable.

RunXcmd is included and designed to do the above but for scripting purposes, when you need your script to wait on the process you are running to terminate, and/or when you or your script needs to know the process exit code via %errorlevel% output.

Either RunX or RunXcmd (depending on your needs) is a suitable replacement for ETS (Elevate To System), which is an older and slower implementation with some limitations that RunX does not have, such as not being able to run from a network drive, in addition to not having the capability of creating processes with TrustedInstaller privileges.

Compatibility and Operability:

- RunX and RunXcmd both work on all versions of Windows.

TOWN CRIER

We lost our veteran bench tech and the intern had to take over his duties temporarily.

Some creatively configured profiles allowed a guy with very little experience to handle 90% of the workload quickly and effectively.
